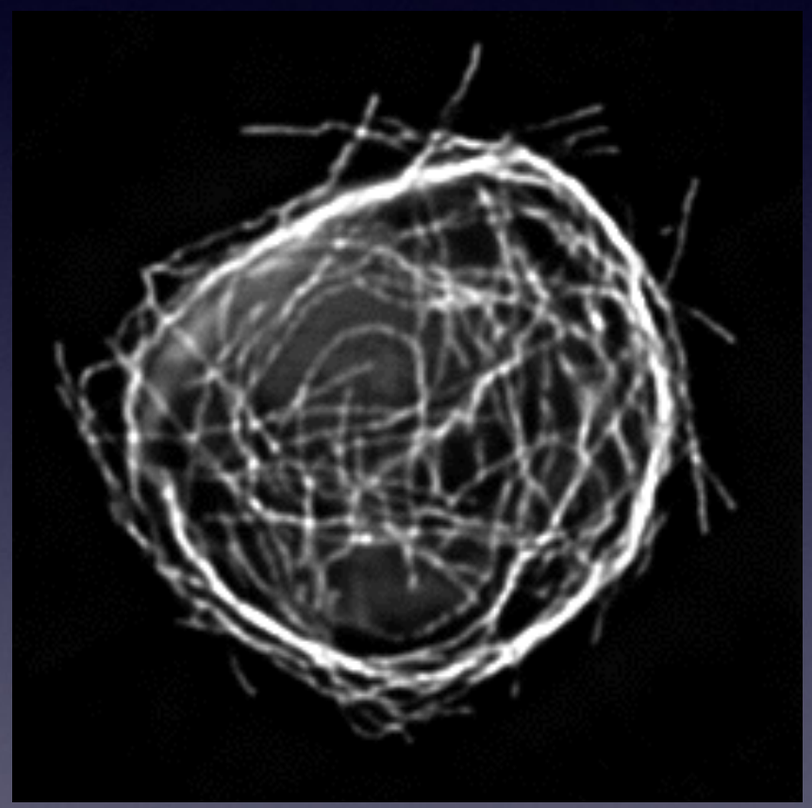
Widefield



Deconvolved Widefield

Micron OXFORD

Lecture 9
Advanced Widefield Microscopy & Bespoke Microscopes

Ian Dobbie
x13323

Overview

- Image formation and airy rings
- Beads and spherical aberration
- How deconvolution works
- Super fast acquisition
- Bespoke microscope design - pro's and cons

Micron OXFORD

What is a microscope image

- The microscope produces a magnified, but also distorted, image
- Record the light intensity on a camera.

Micron OXFORD

Microscopic imaging in mathematical terms.

- Take your sample
- Multiple it at every point by the imaging process in the microscope (convolve the PSF with the object).
- Produce the image.

The most important things to think about.

Contrast :- What is the difference between what you want to see and everything else?

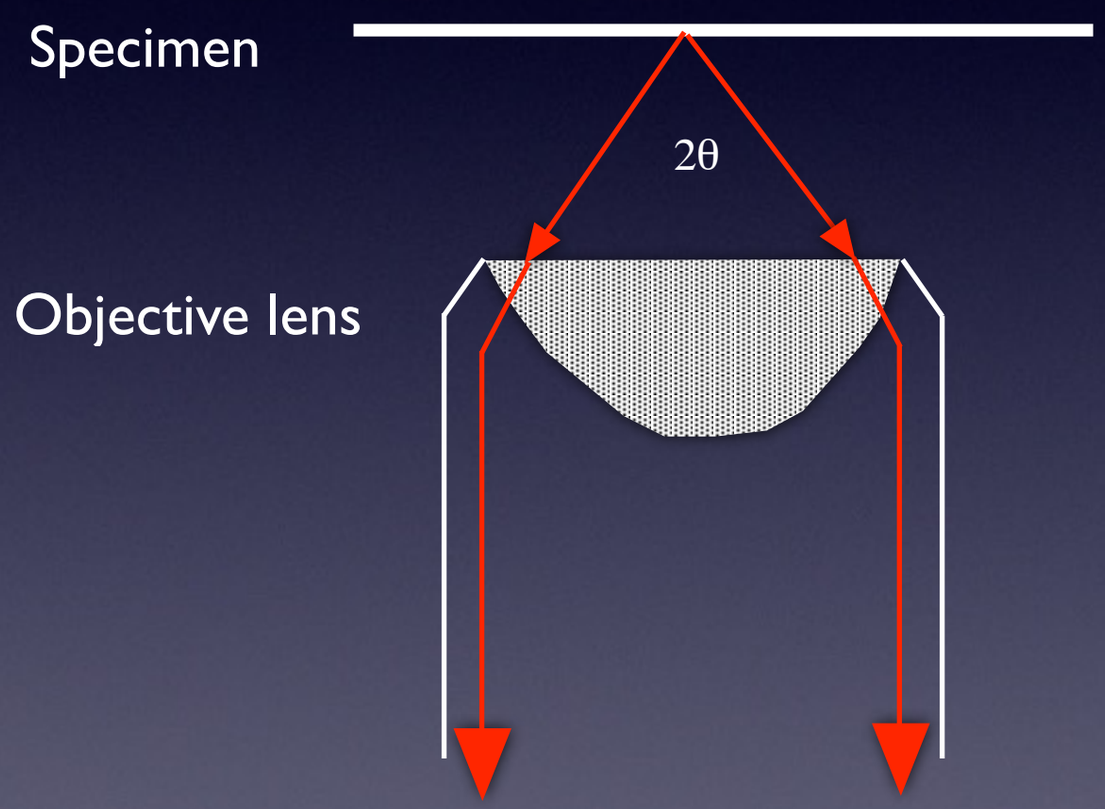
Resolution :- How small things can you see?

Nothing else

Micron OXFORD

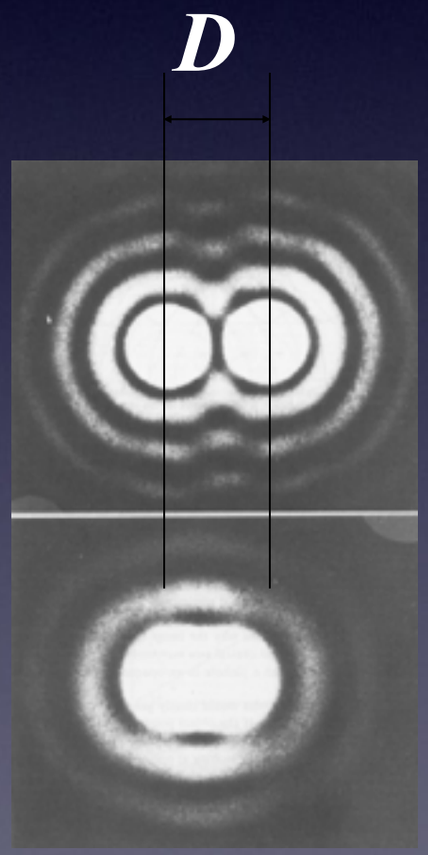
Microscope Resolution

- No lens has perfect resolution, even in theory
- Resolution depends on the angle (θ) of the cone of light that the objective can collect from the specimen.
- Rule of thumb: Resolution limit ~ $\lambda/2$



Micron OXFORD

Resolution: A technical definition, the Rayleigh Criterion



D, the distance of two closest points that can be distinguished

$$D=1.22\ \lambda/(NA_{obj}+NA_{cond})$$

Epi-Fluorescence: $NA_{cond} = Na_{obj}$
so $D=1.22\lambda/2NA$

Micron OXFORD

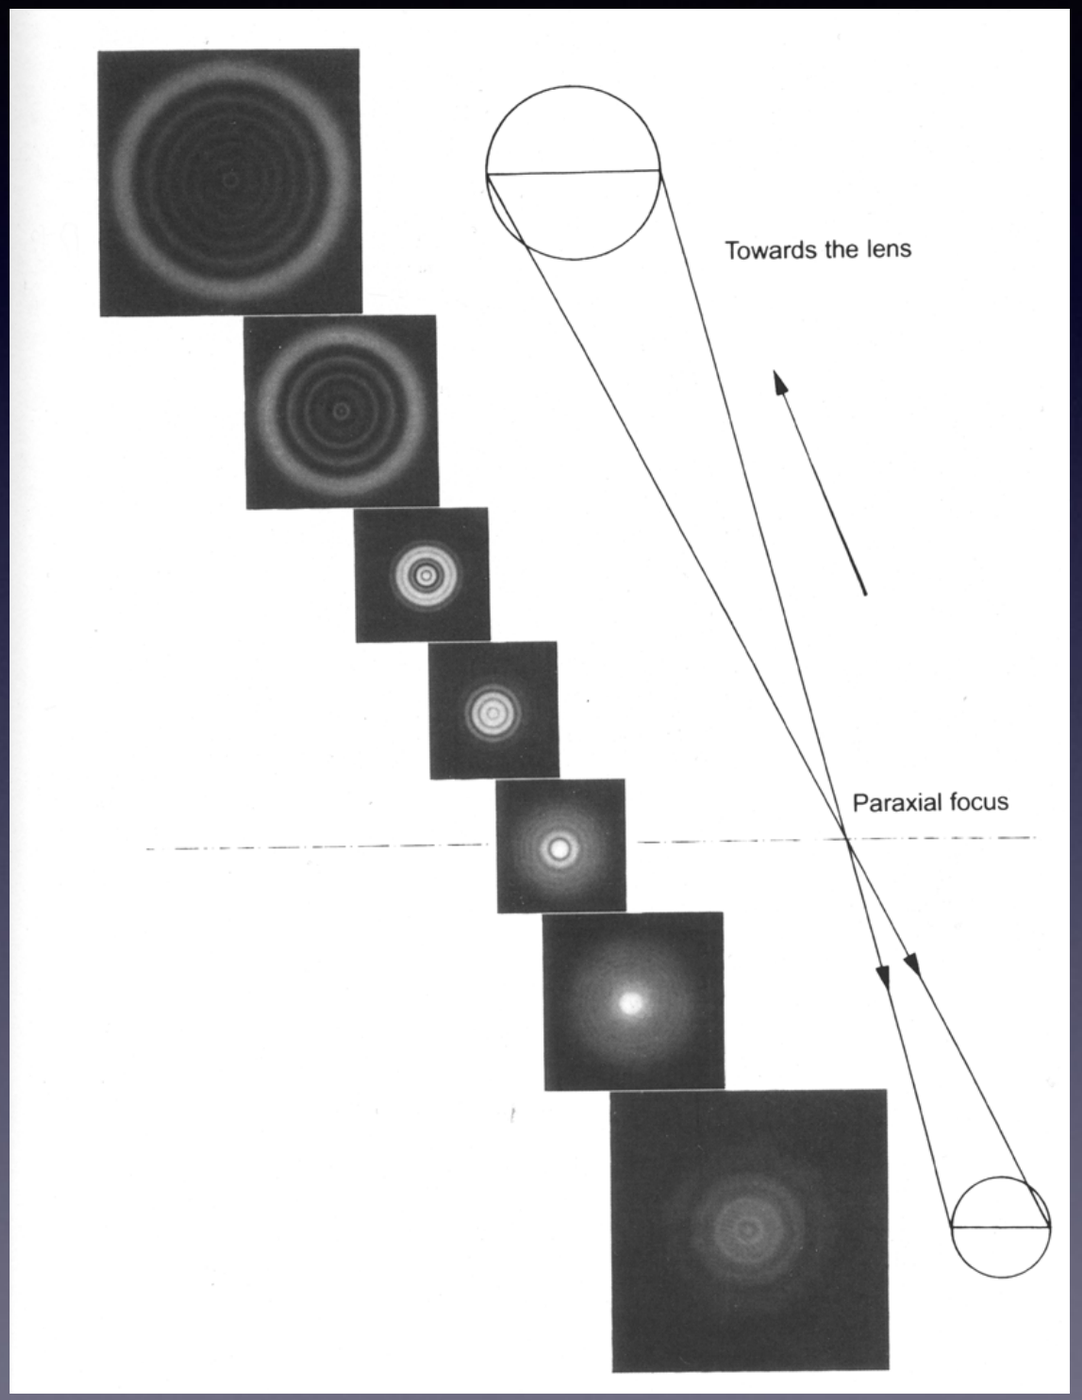
The Point Spread Function - PSF

- The image of an infinitely small point.
- Limited by resolution
- 3D structure also very important.

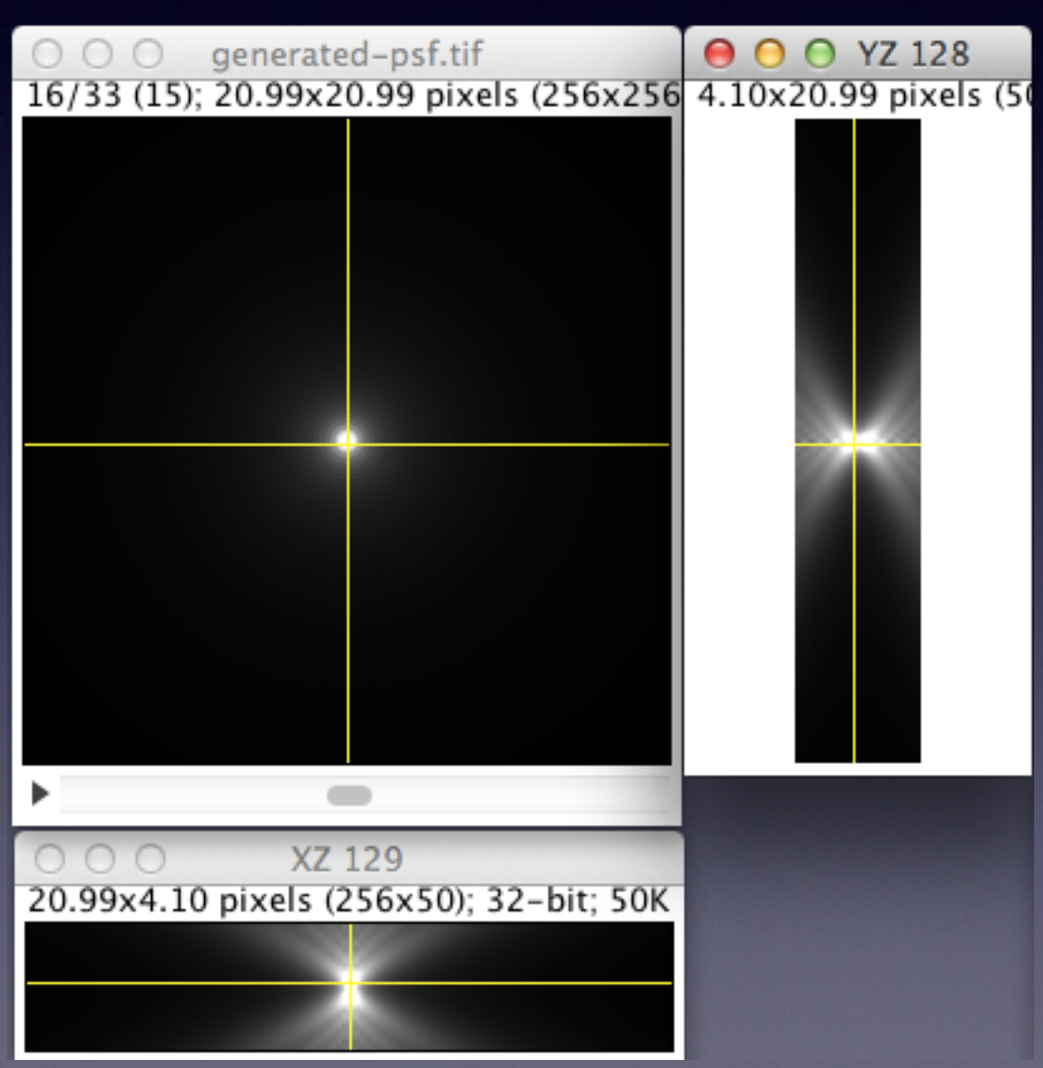
Micron OXFORD

Image quality- the problem of "out-of-focus light" point spread function and airy rings

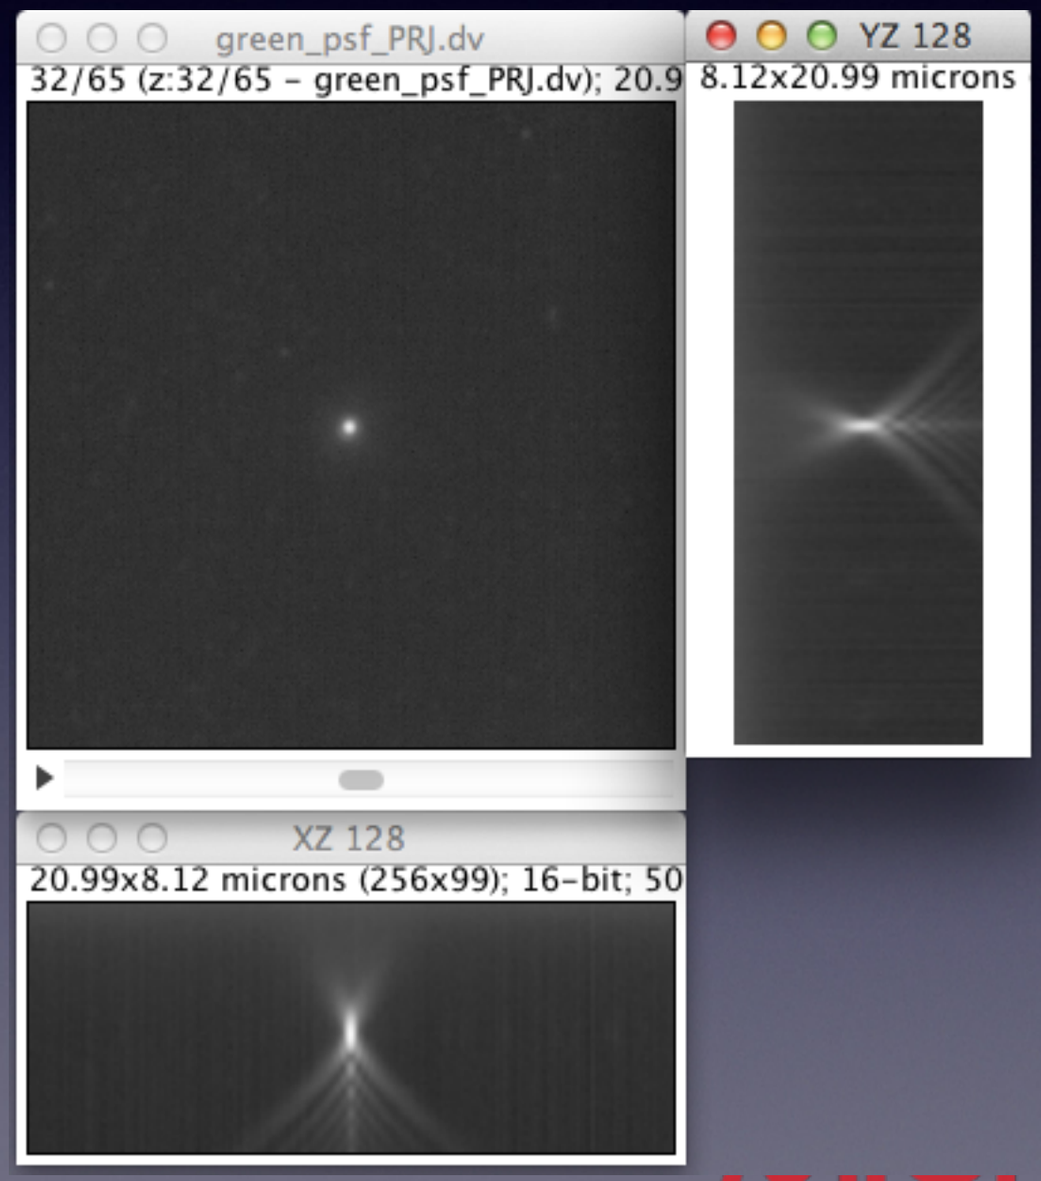
Sample object: a "sub-resolution" fluorescent bead



Theoretical and measured PSF Orthogonal views

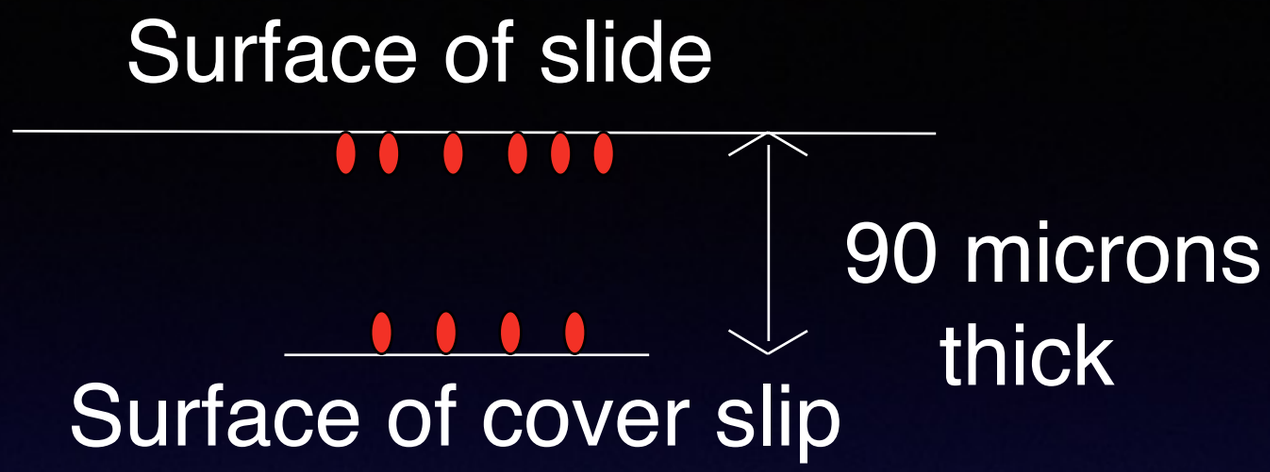


Generated PSF



Real PSF

Bead slide



Tetraspeck beads: chromatic registration
DAPI/FITC/Rhodamine/Cy5

Beads (PS Spec): Single fluorochrome
Brighter -better for generating
point spread functions for deconvolution

Inspec Intensity beads: Measure dynamic range

Micron OXFORD

Affects of deep imaging (90μm) and collar settings on spherical aberration and psf of 60X/NA1.2w

Micron OXFORD

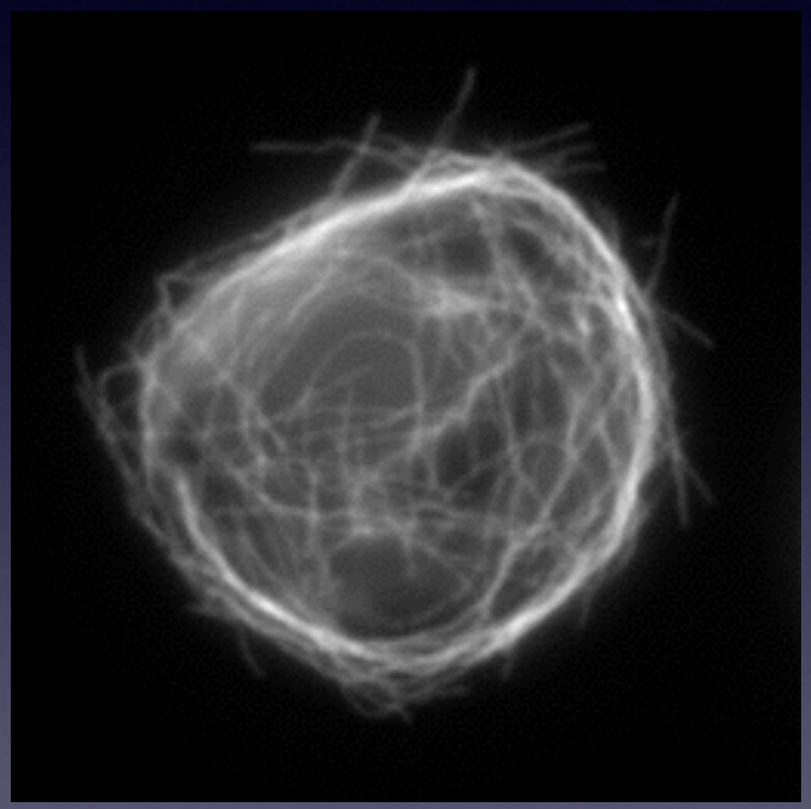
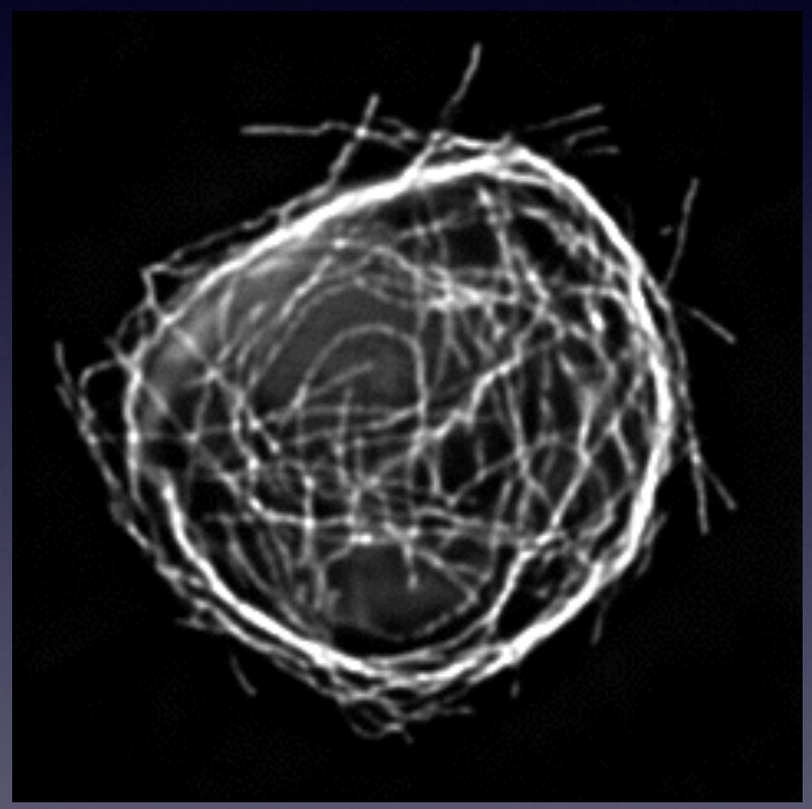
Original Image versus Deconvolved image.



Widefield

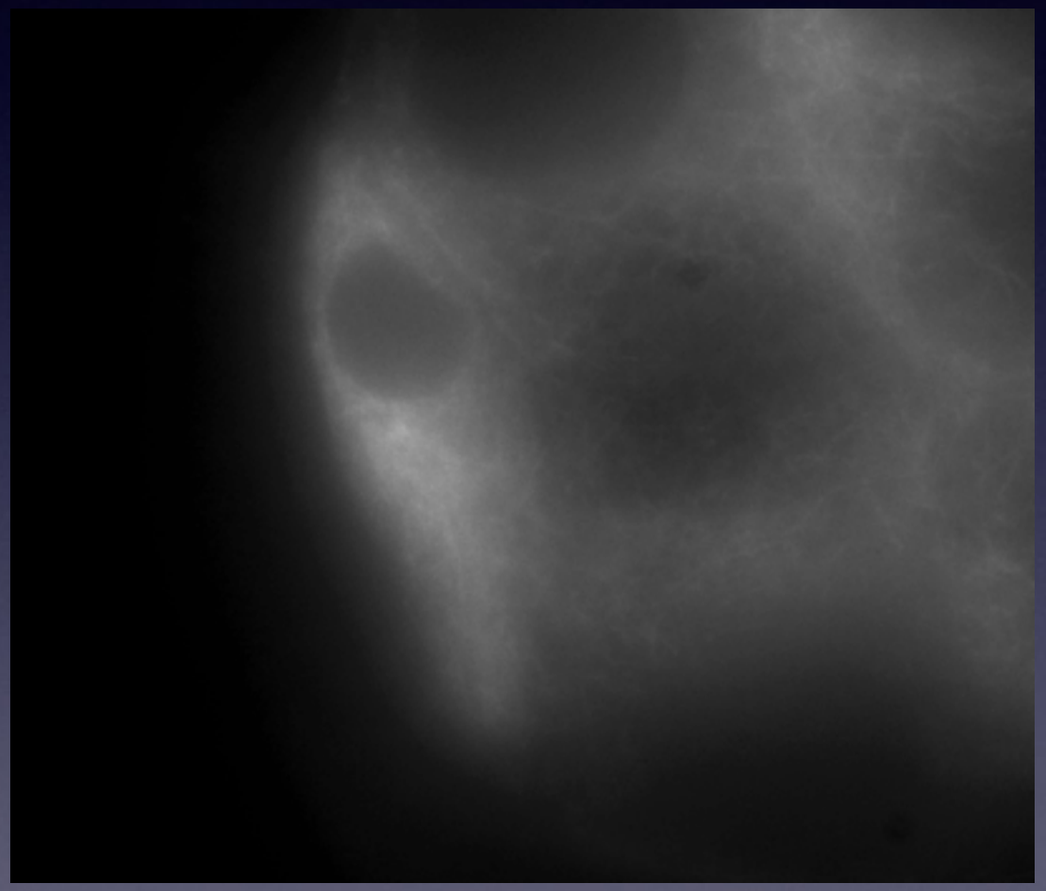


Deconvolved Widefield

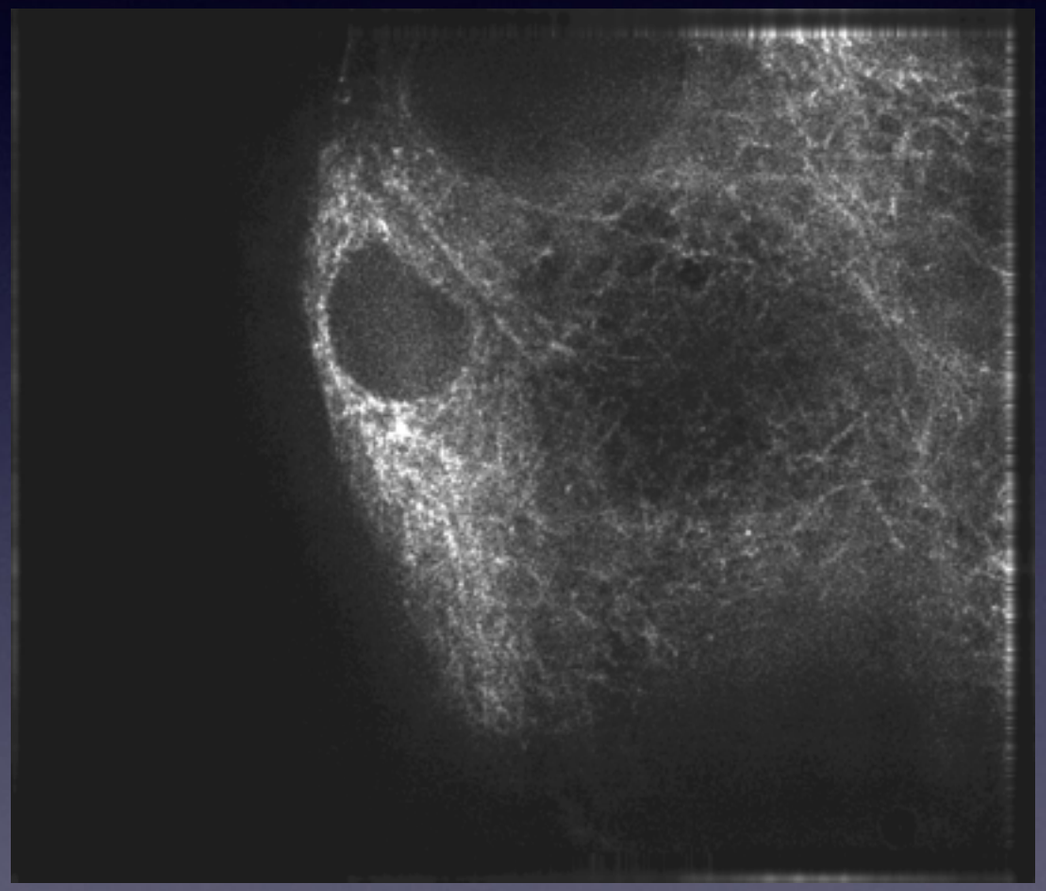
Micron OXFORD

A real example of deconvolution

Before deconvolution



After deconvolution

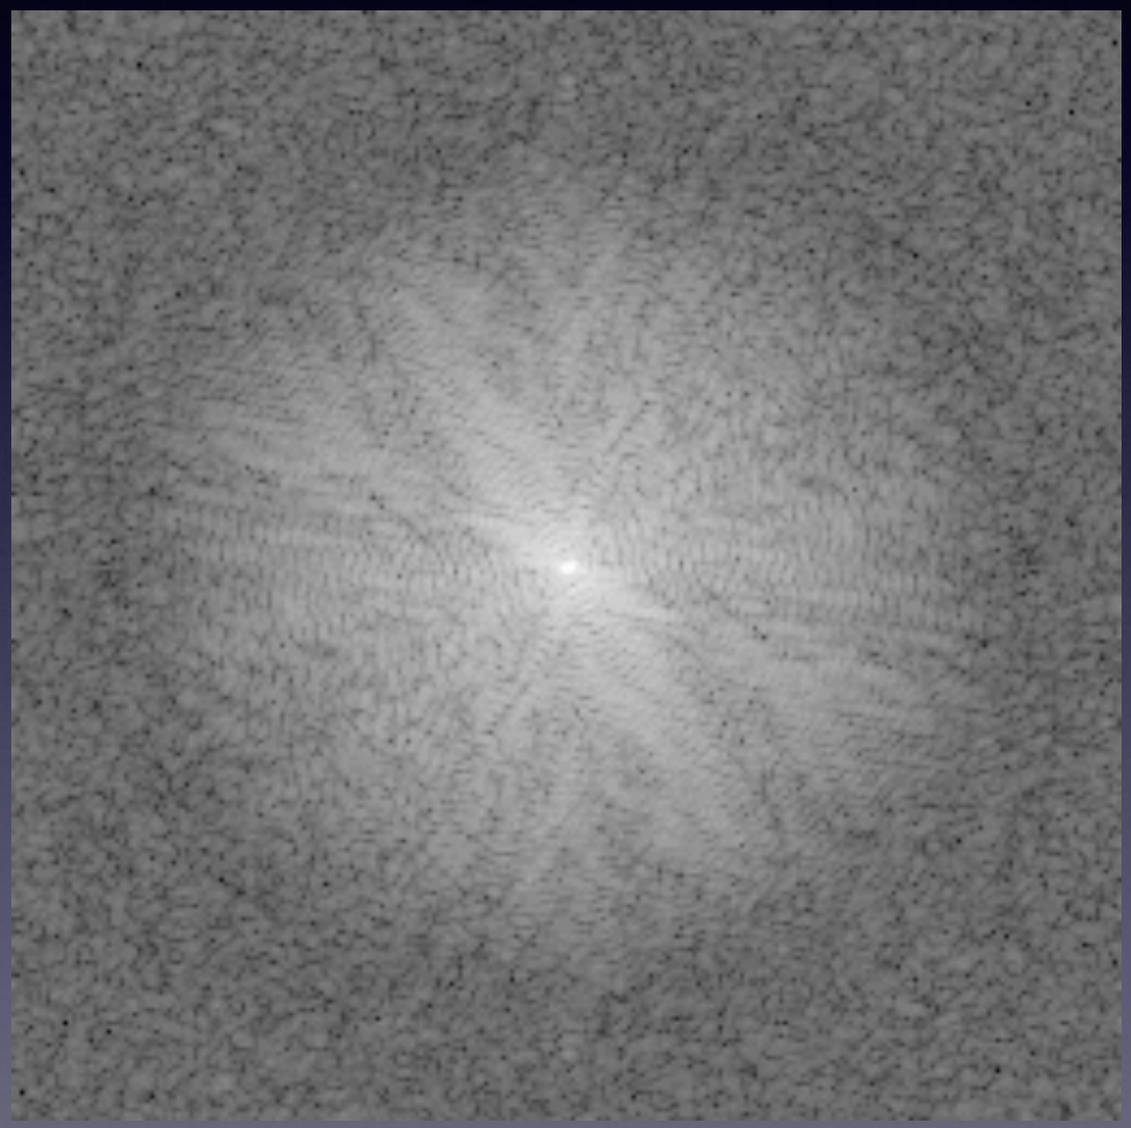


Micron OXFORD

Improvements in Deconvolution

- Increases contrast as out of focus background is removed
- Reduces signal spread, hence increases resolution

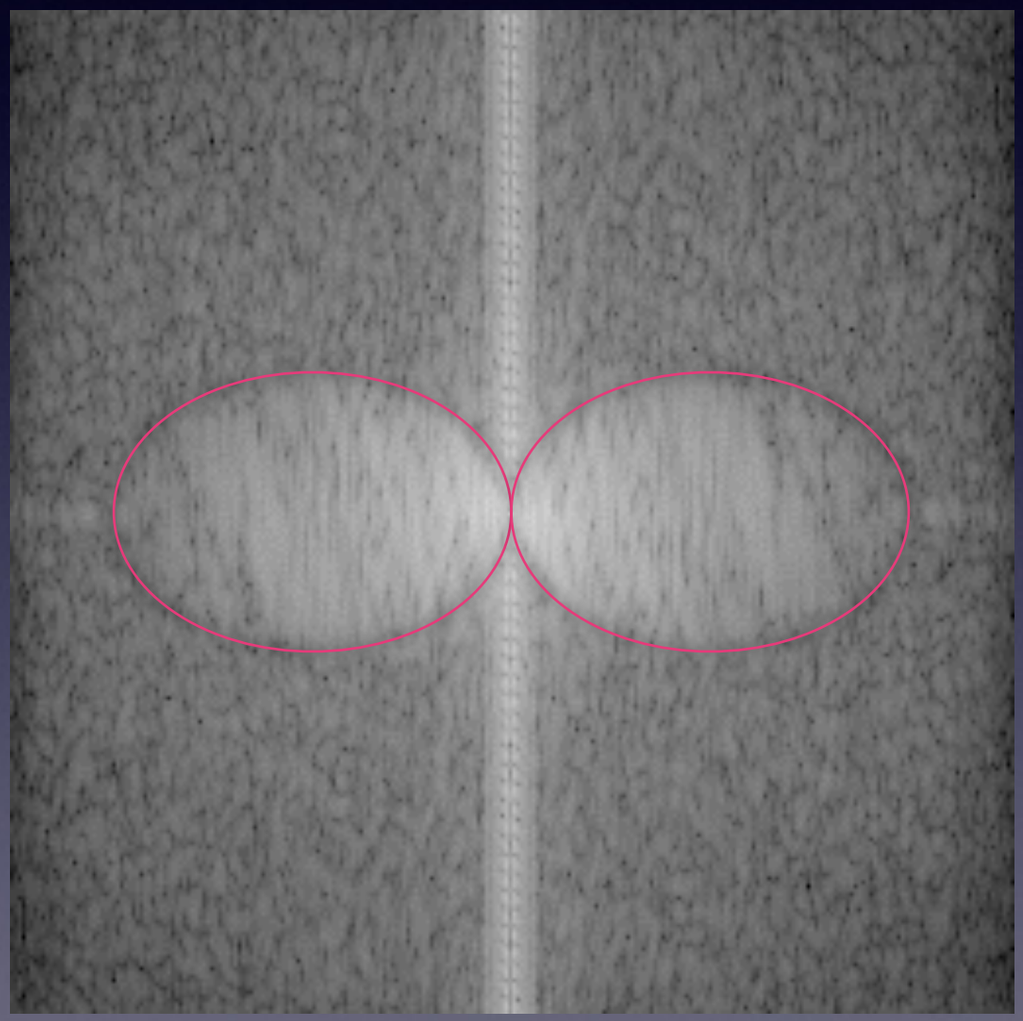
Fourier Transform



FFT of a single slice (Z plane) of image stack

Micron OXFORD

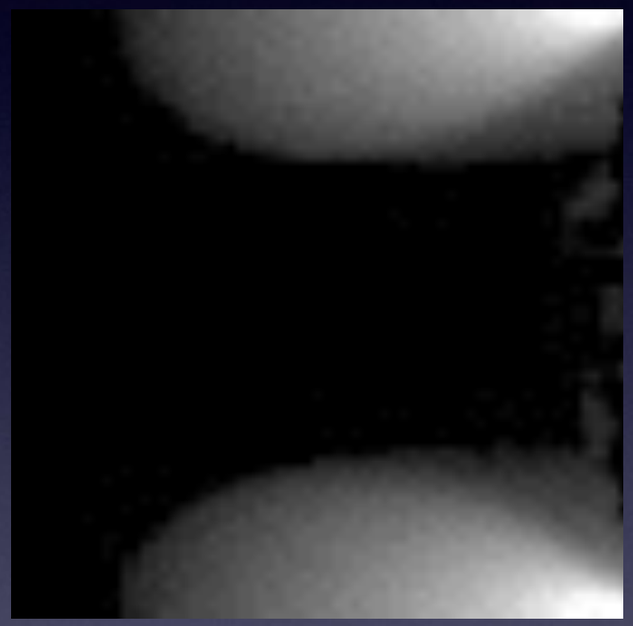
Fourier Transforms in XZ plane



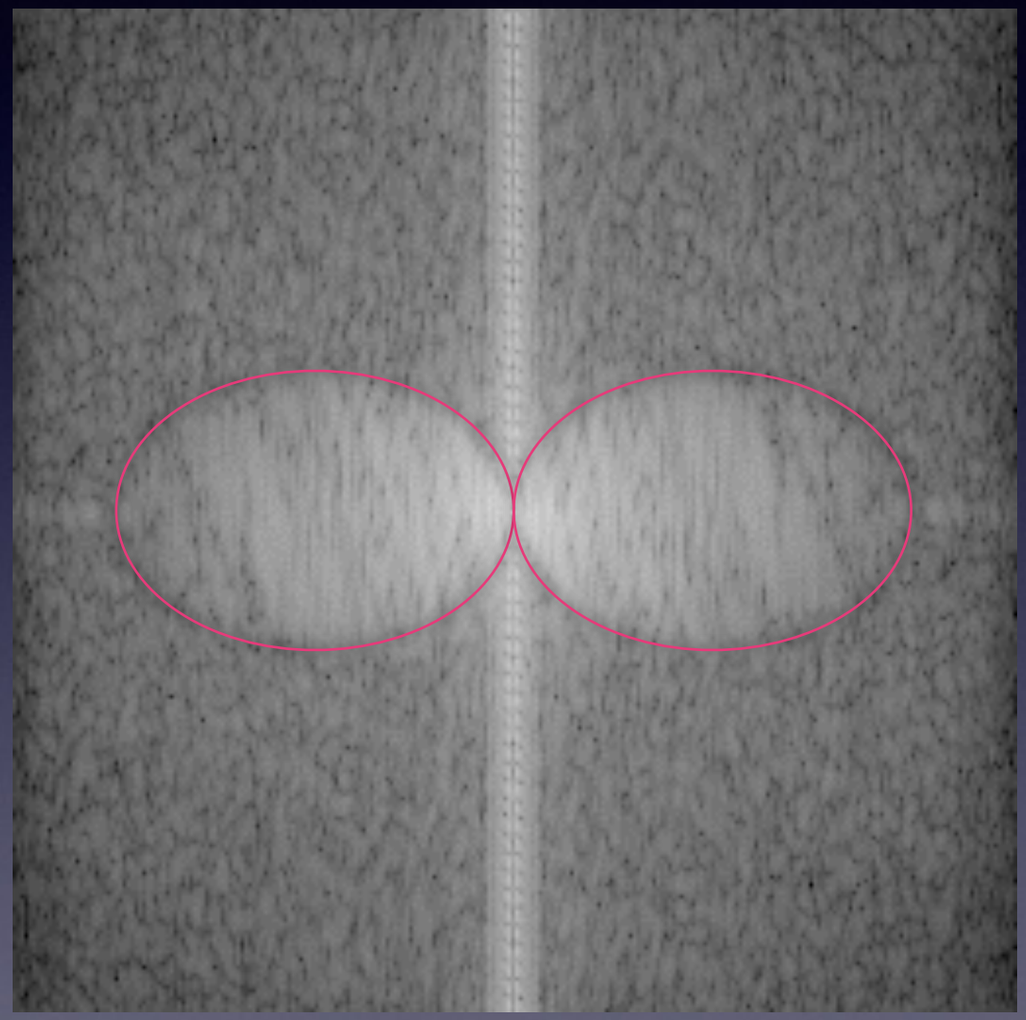
FFT of an orthogonal slice of image stack

Micron OXFORD

Applying the PSF in practice



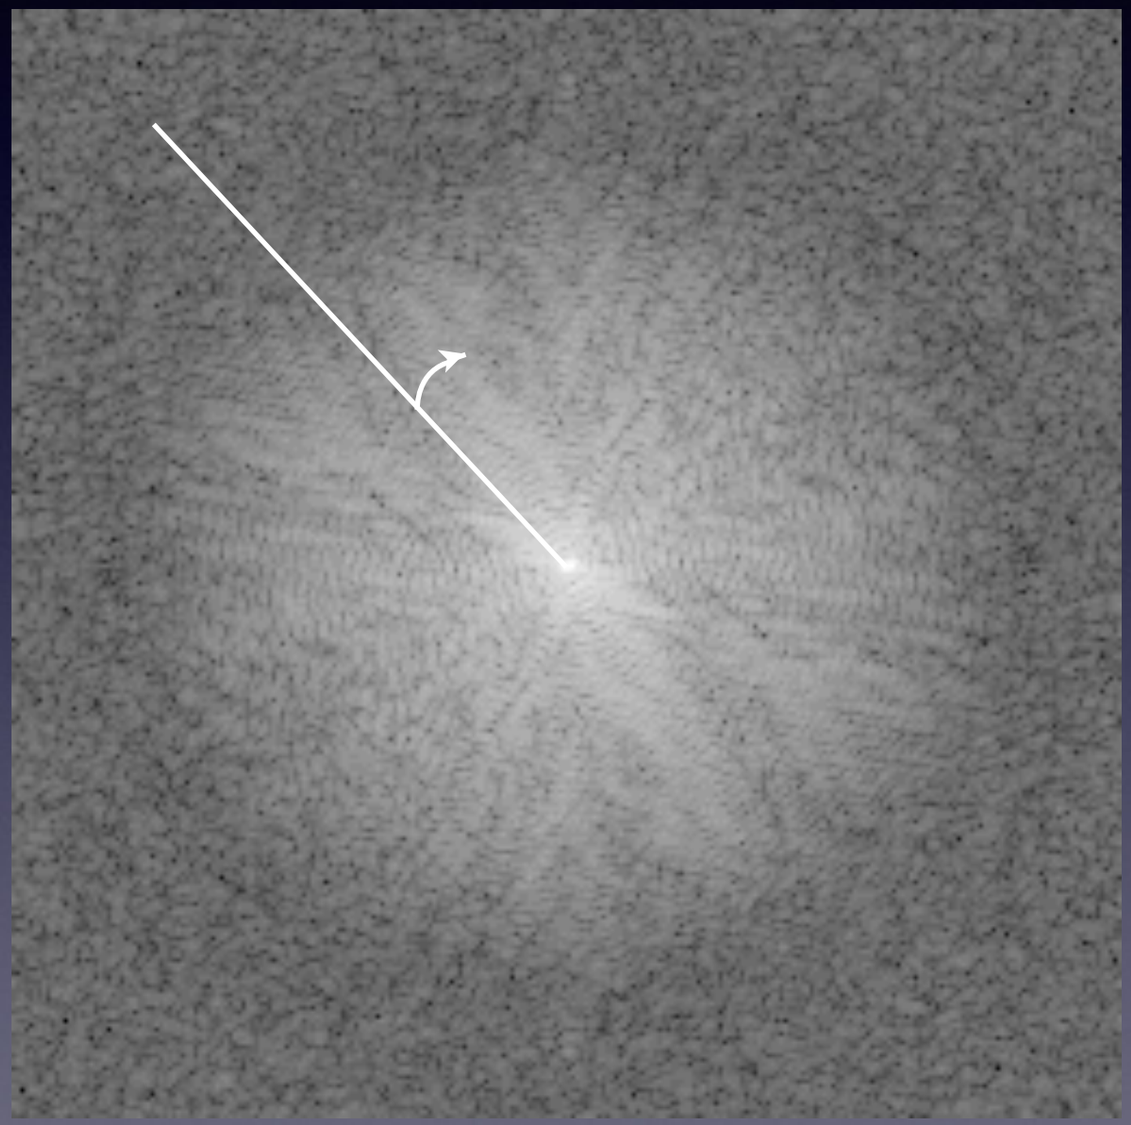
Optical Transfer Function
OTF - FFT of the PSF



FFT of an XZ section of
the real image

Micron
OXFORD

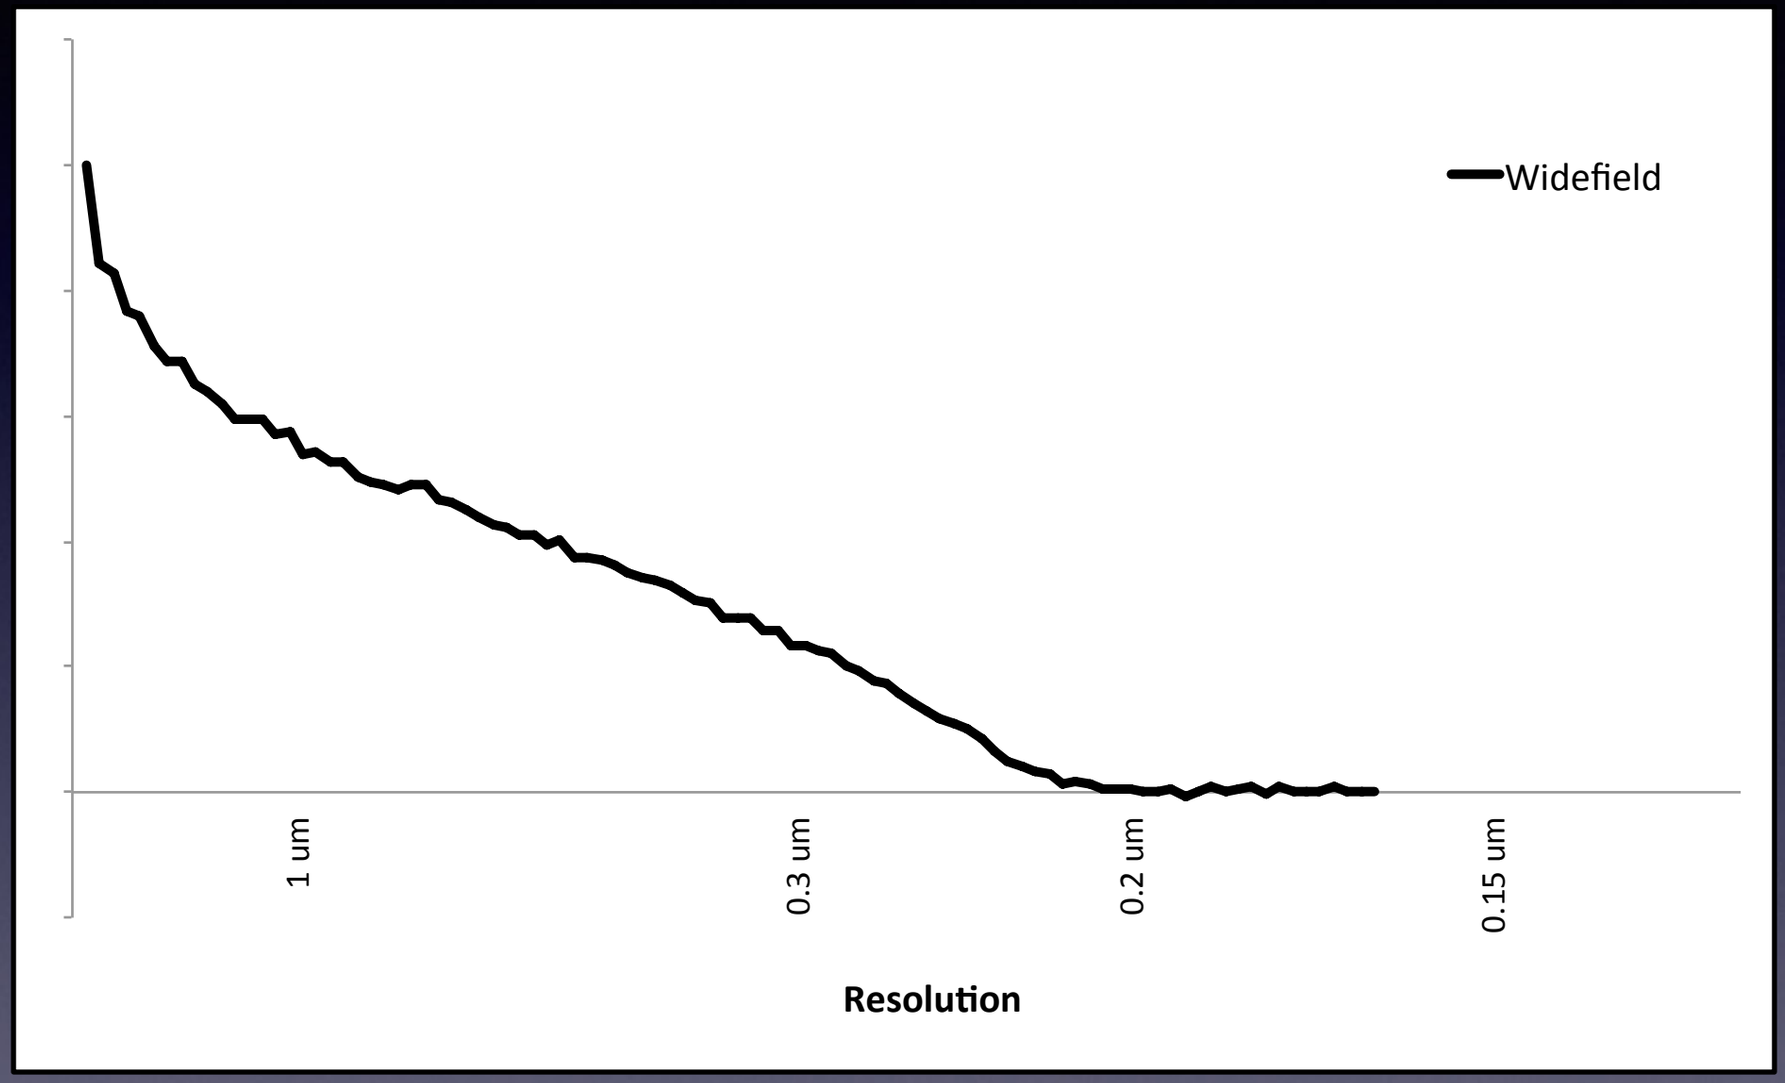
Fourier Transforms to Assess Resolution



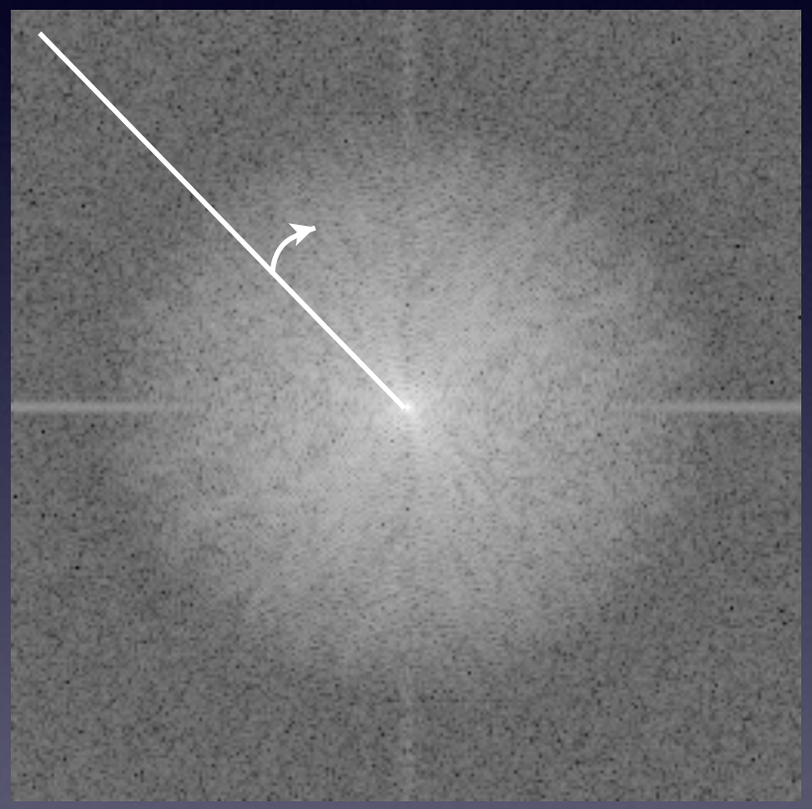
FFT of a single slice (Z plane) of image stack

Micron OXFORD

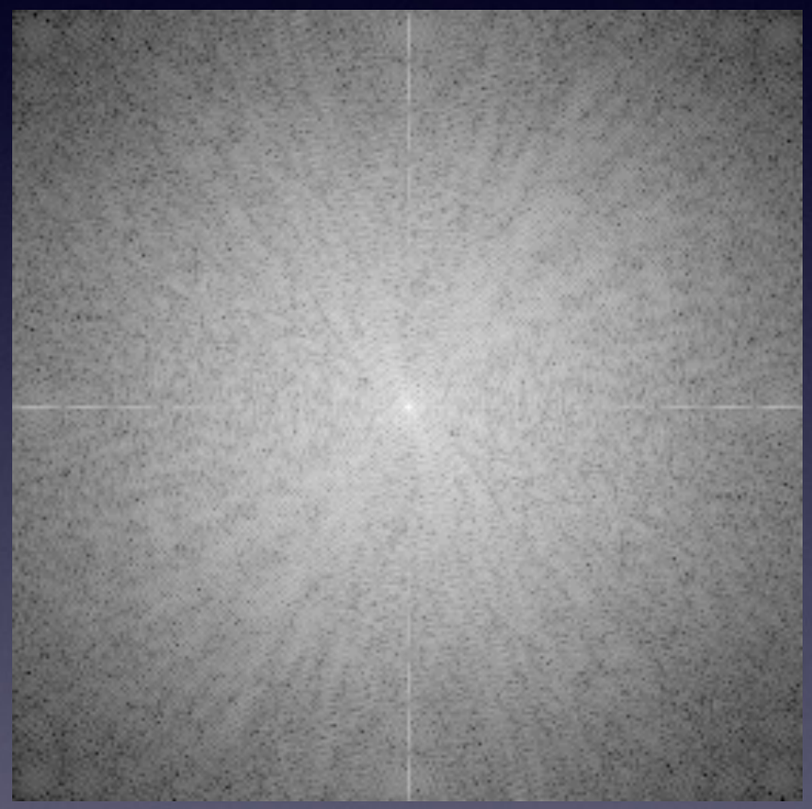
Radial Integrals of FTs



Fourier Transforms to Assess Resolution



FFT of Widefield

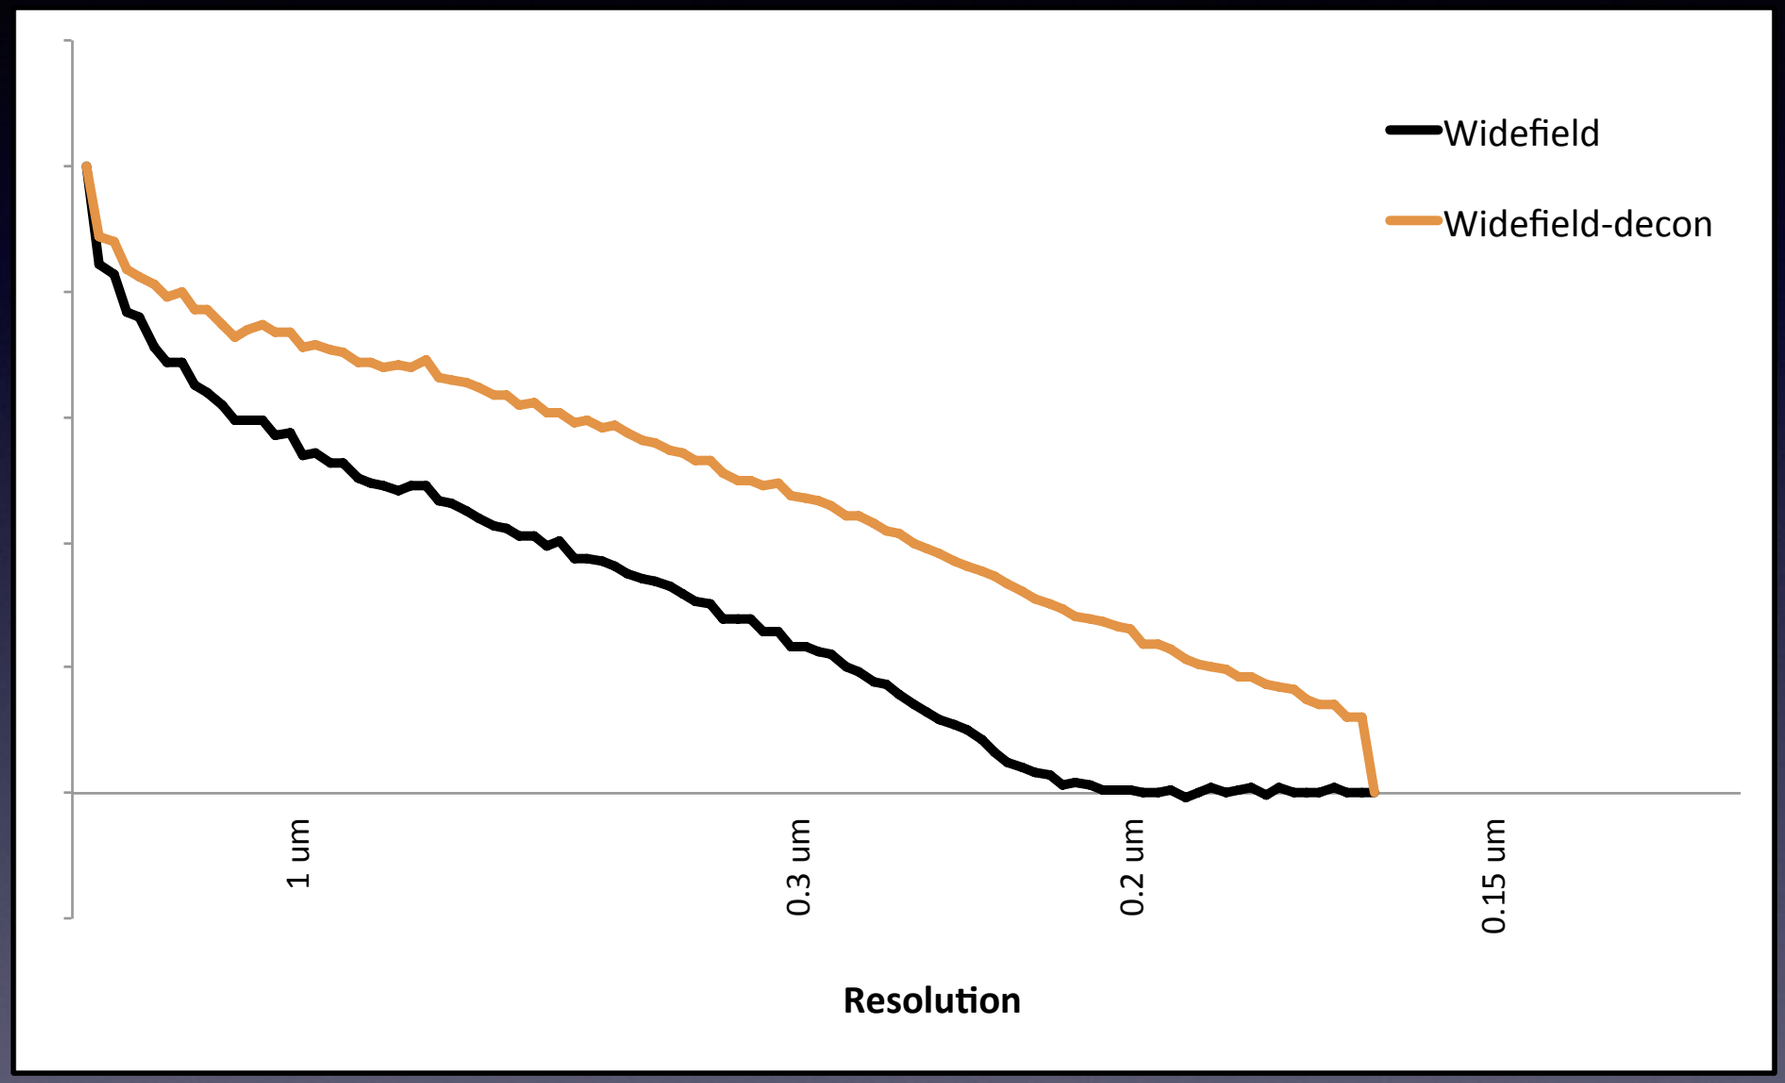


FFT of deconvolved Widefield

FTs of Microtubule images at equivalent scale

Micron OXFORD

Radial Integrals of FTs



How a DIC prism effects fluorescence imaging

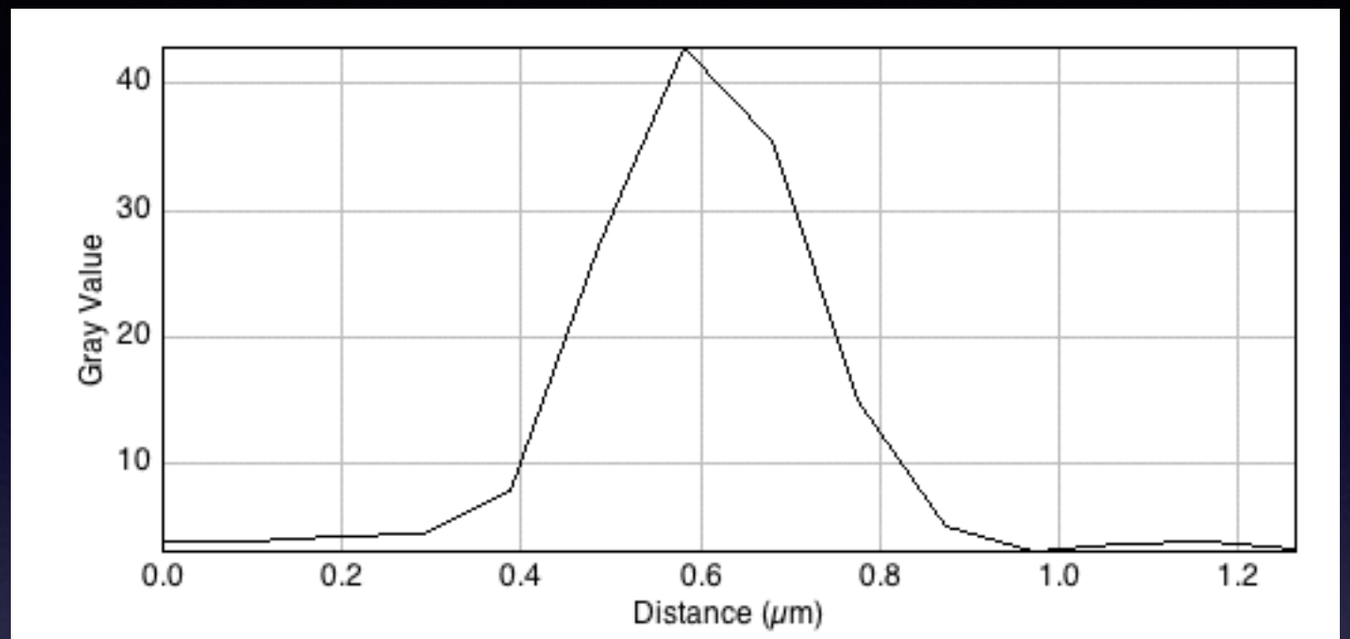
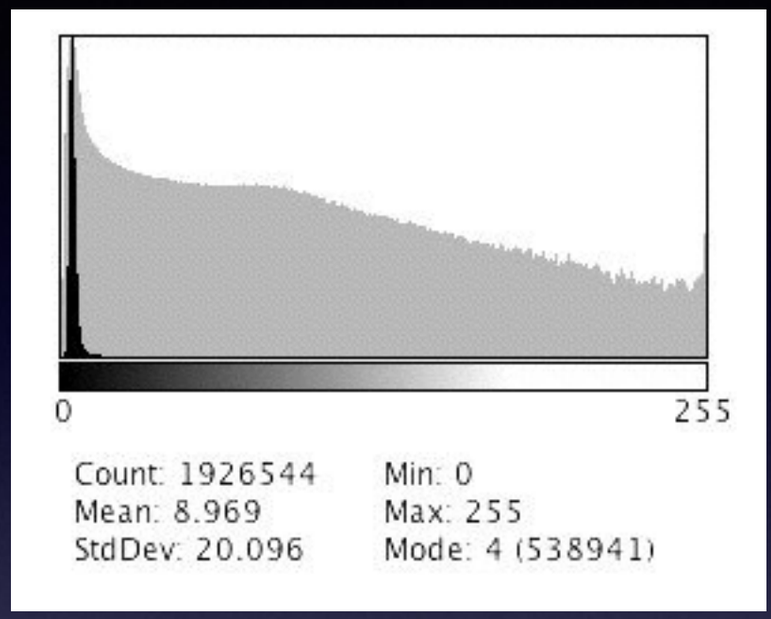
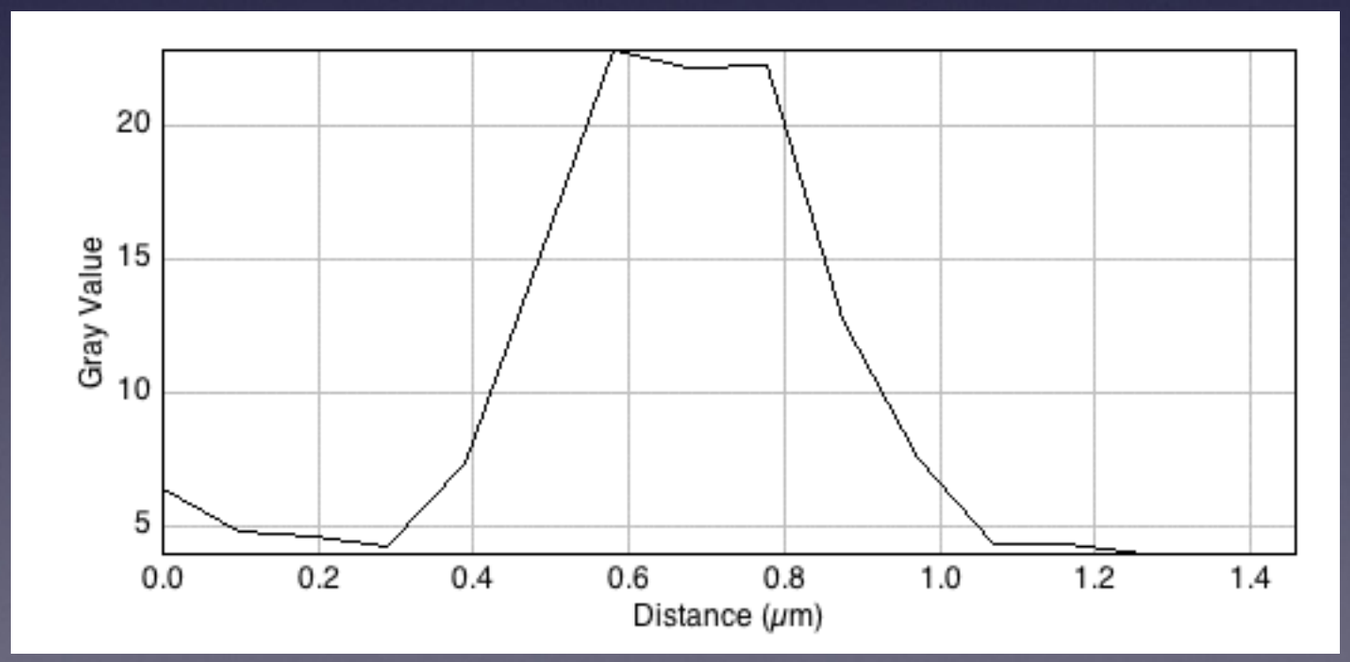
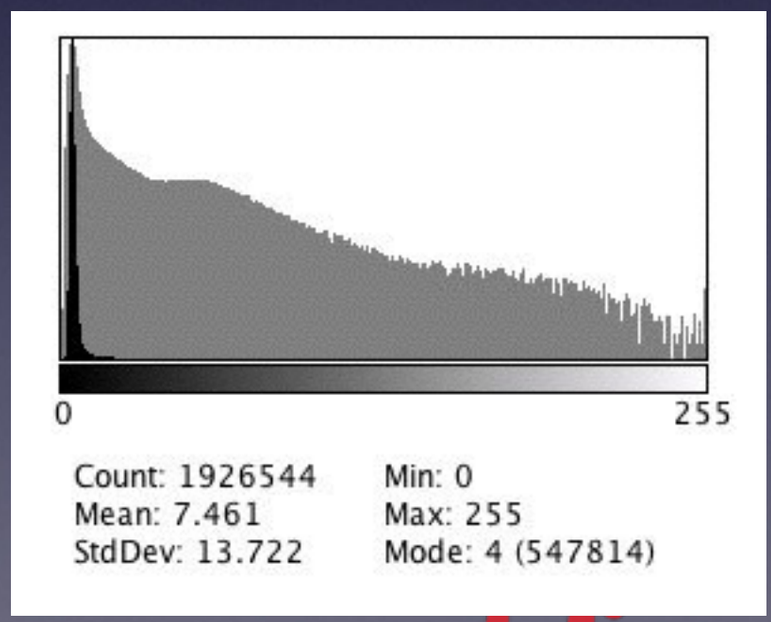
Line scans and histograms



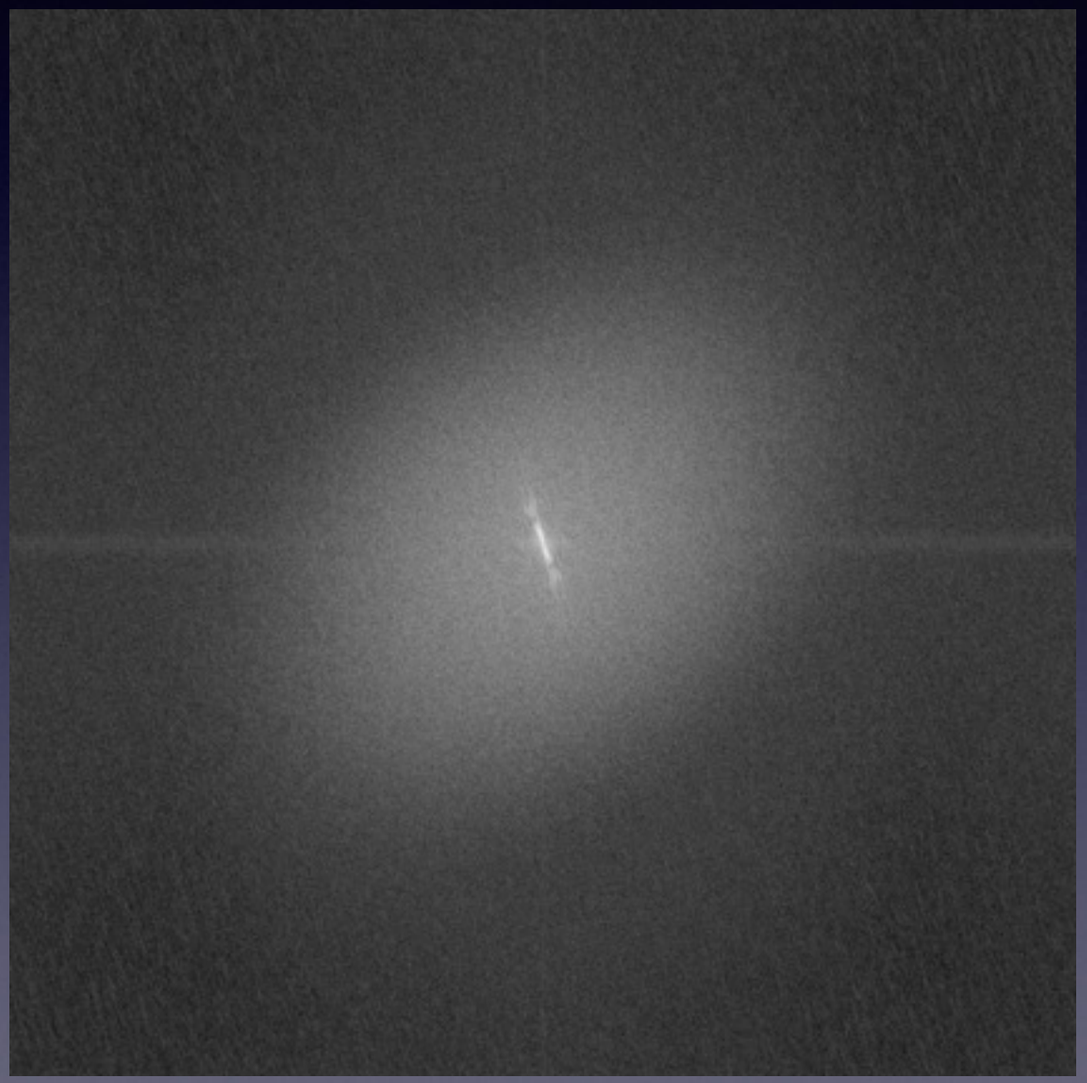


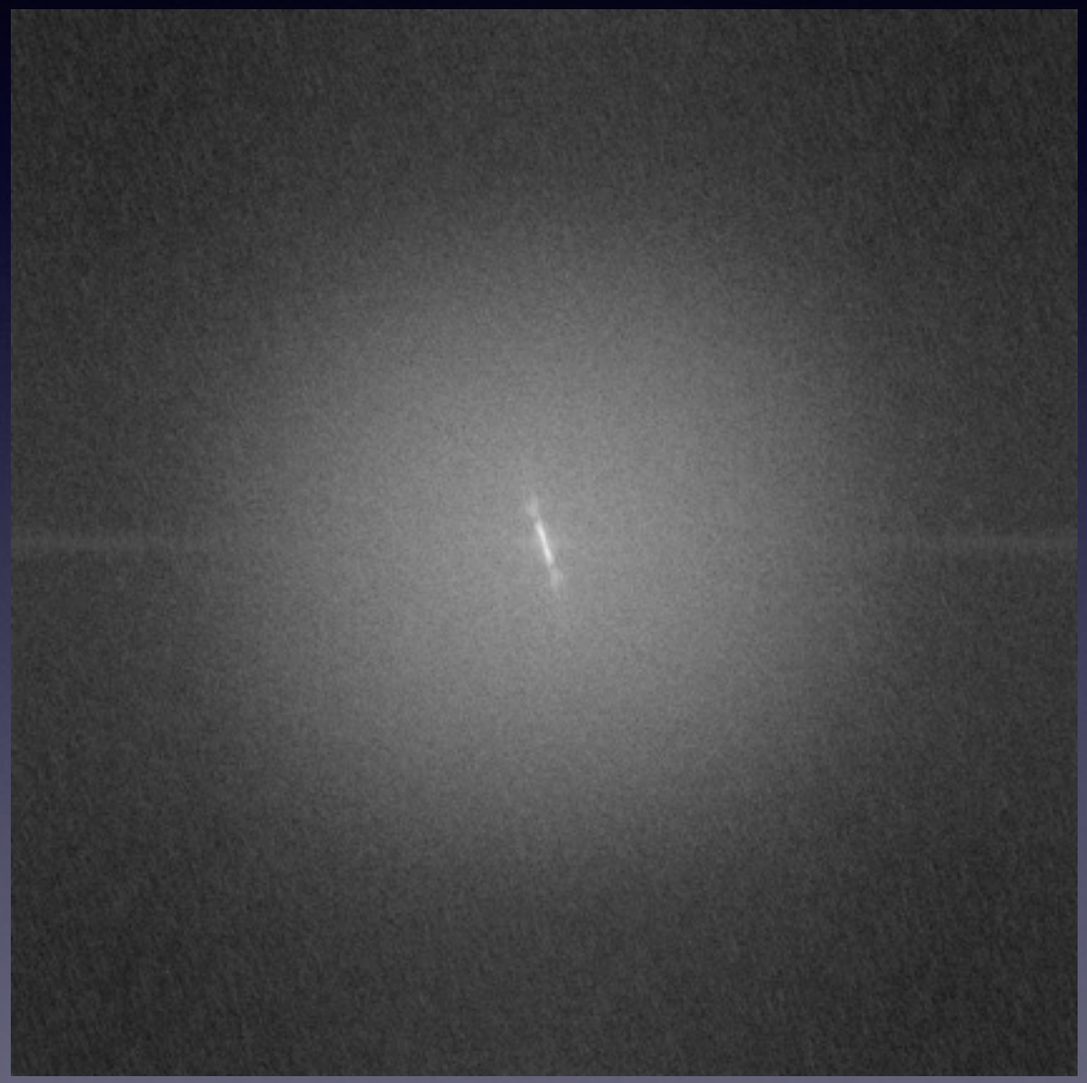




Micron OXFORD

FFTs with/without DIC prism





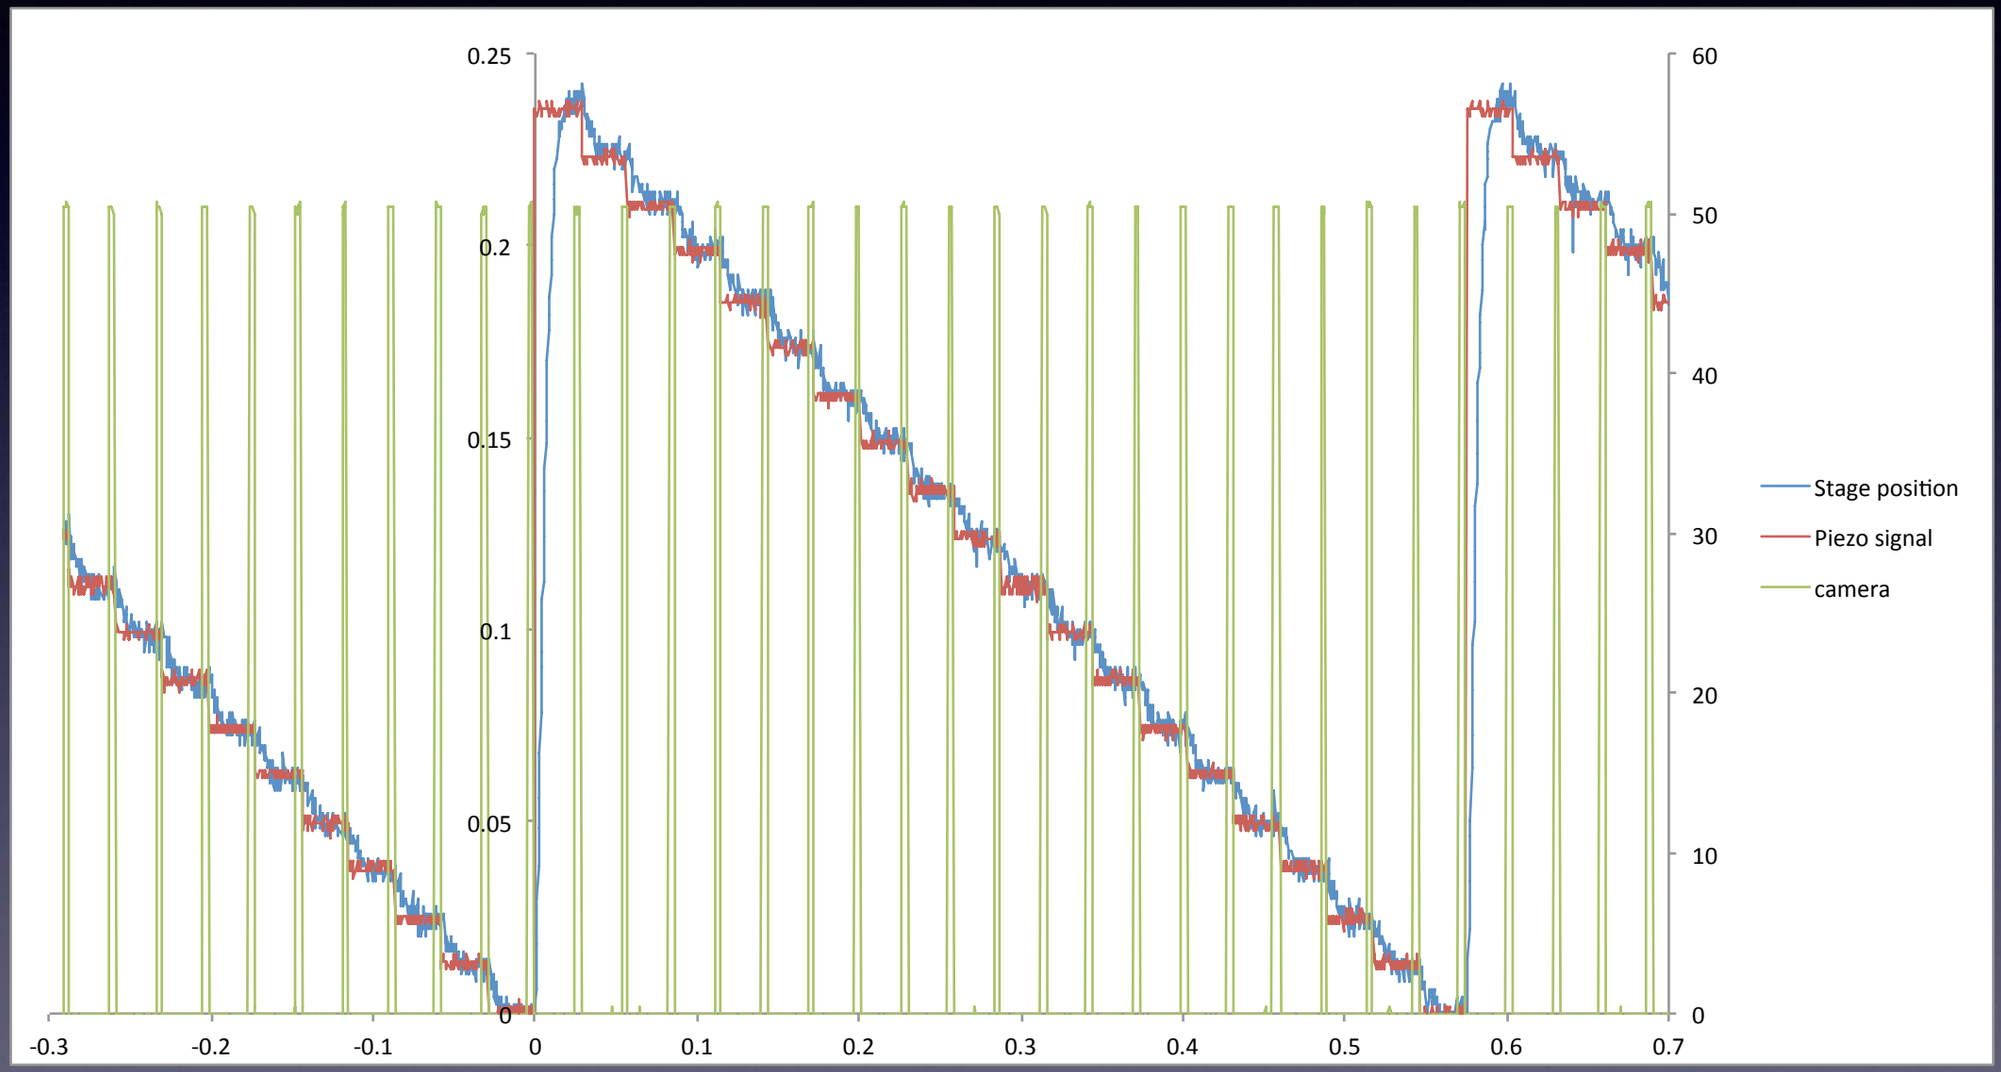
Micron OXFORD

Super Fast Acquisition (FastZ)

- Ramp the Z position instead of stepping it
- Take images as fast as possible during ramp
- Delay between stacks to allow stage to return to initial position

Micron OXFORD

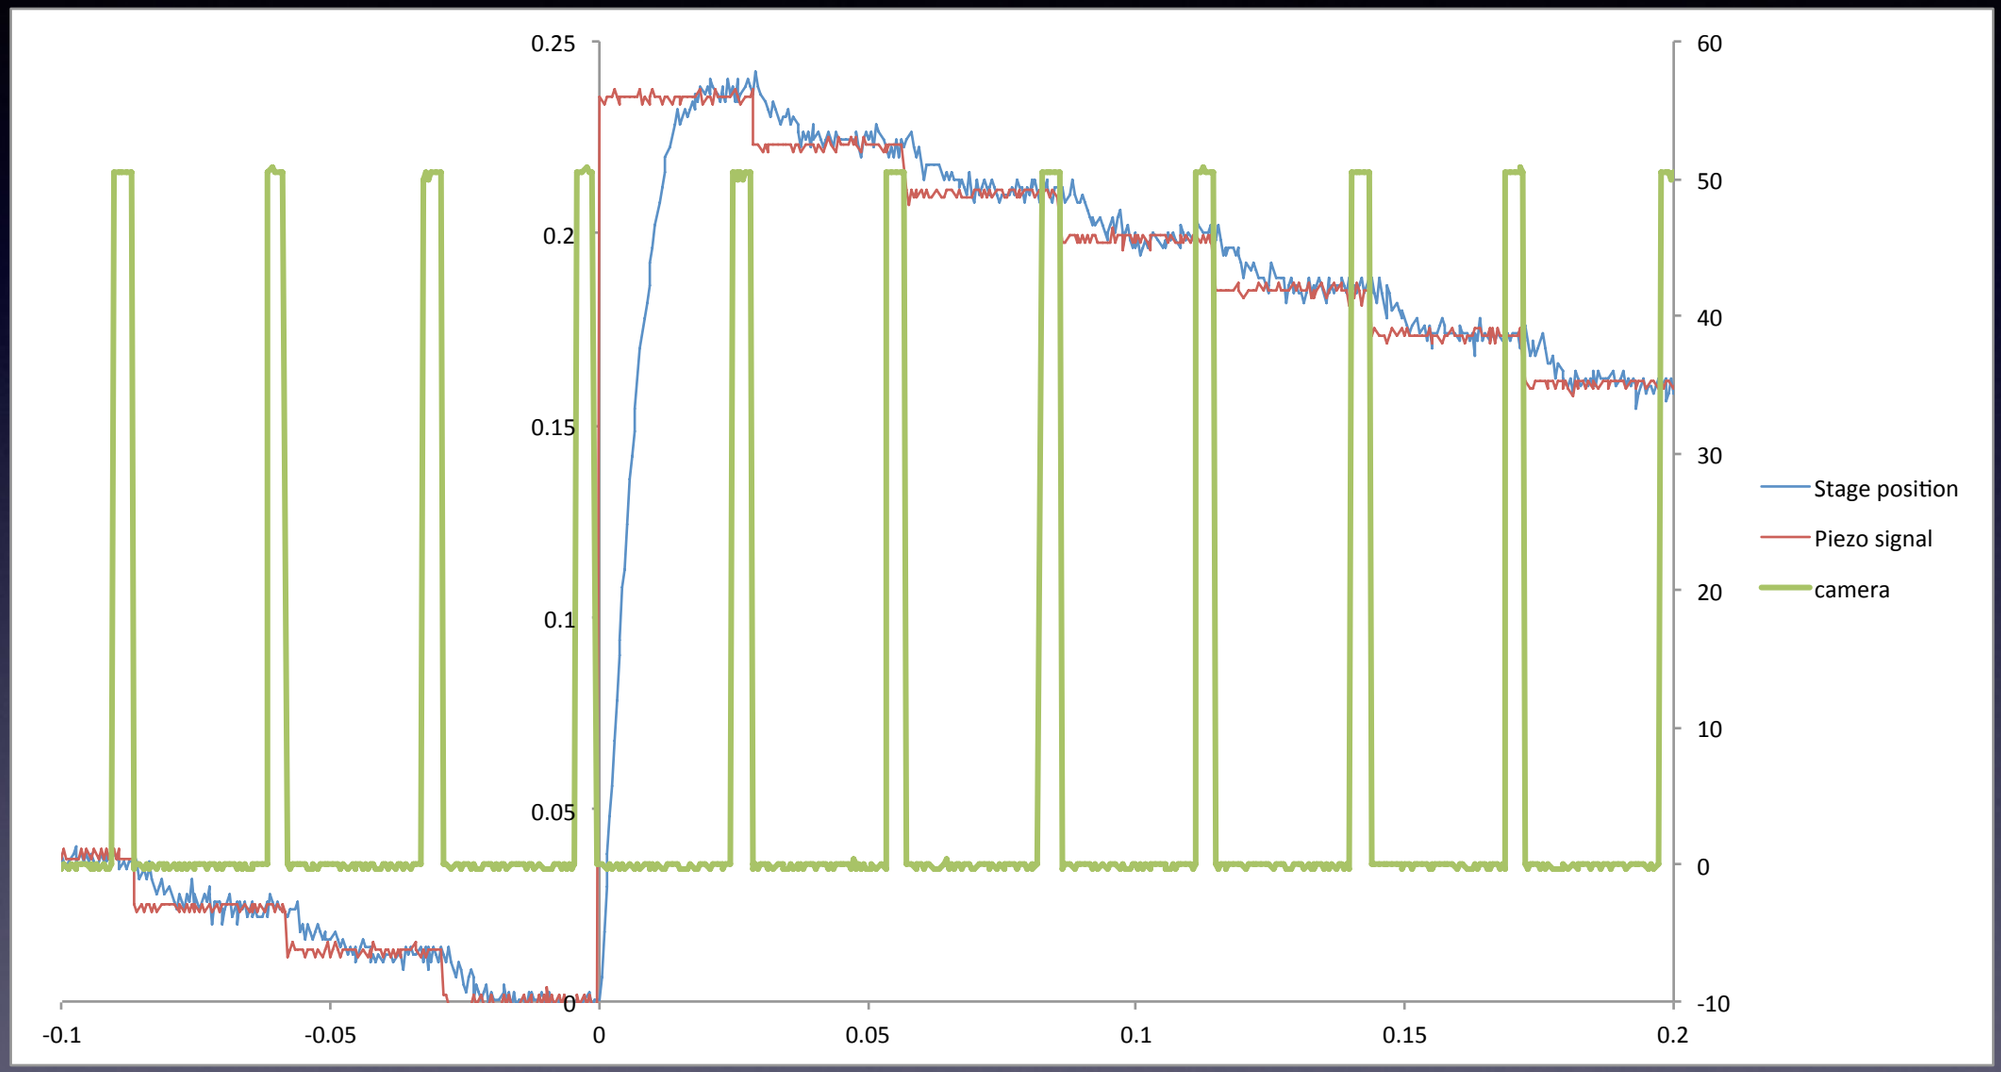
Covential widefield Z stack



20 Z planes as fast as possible

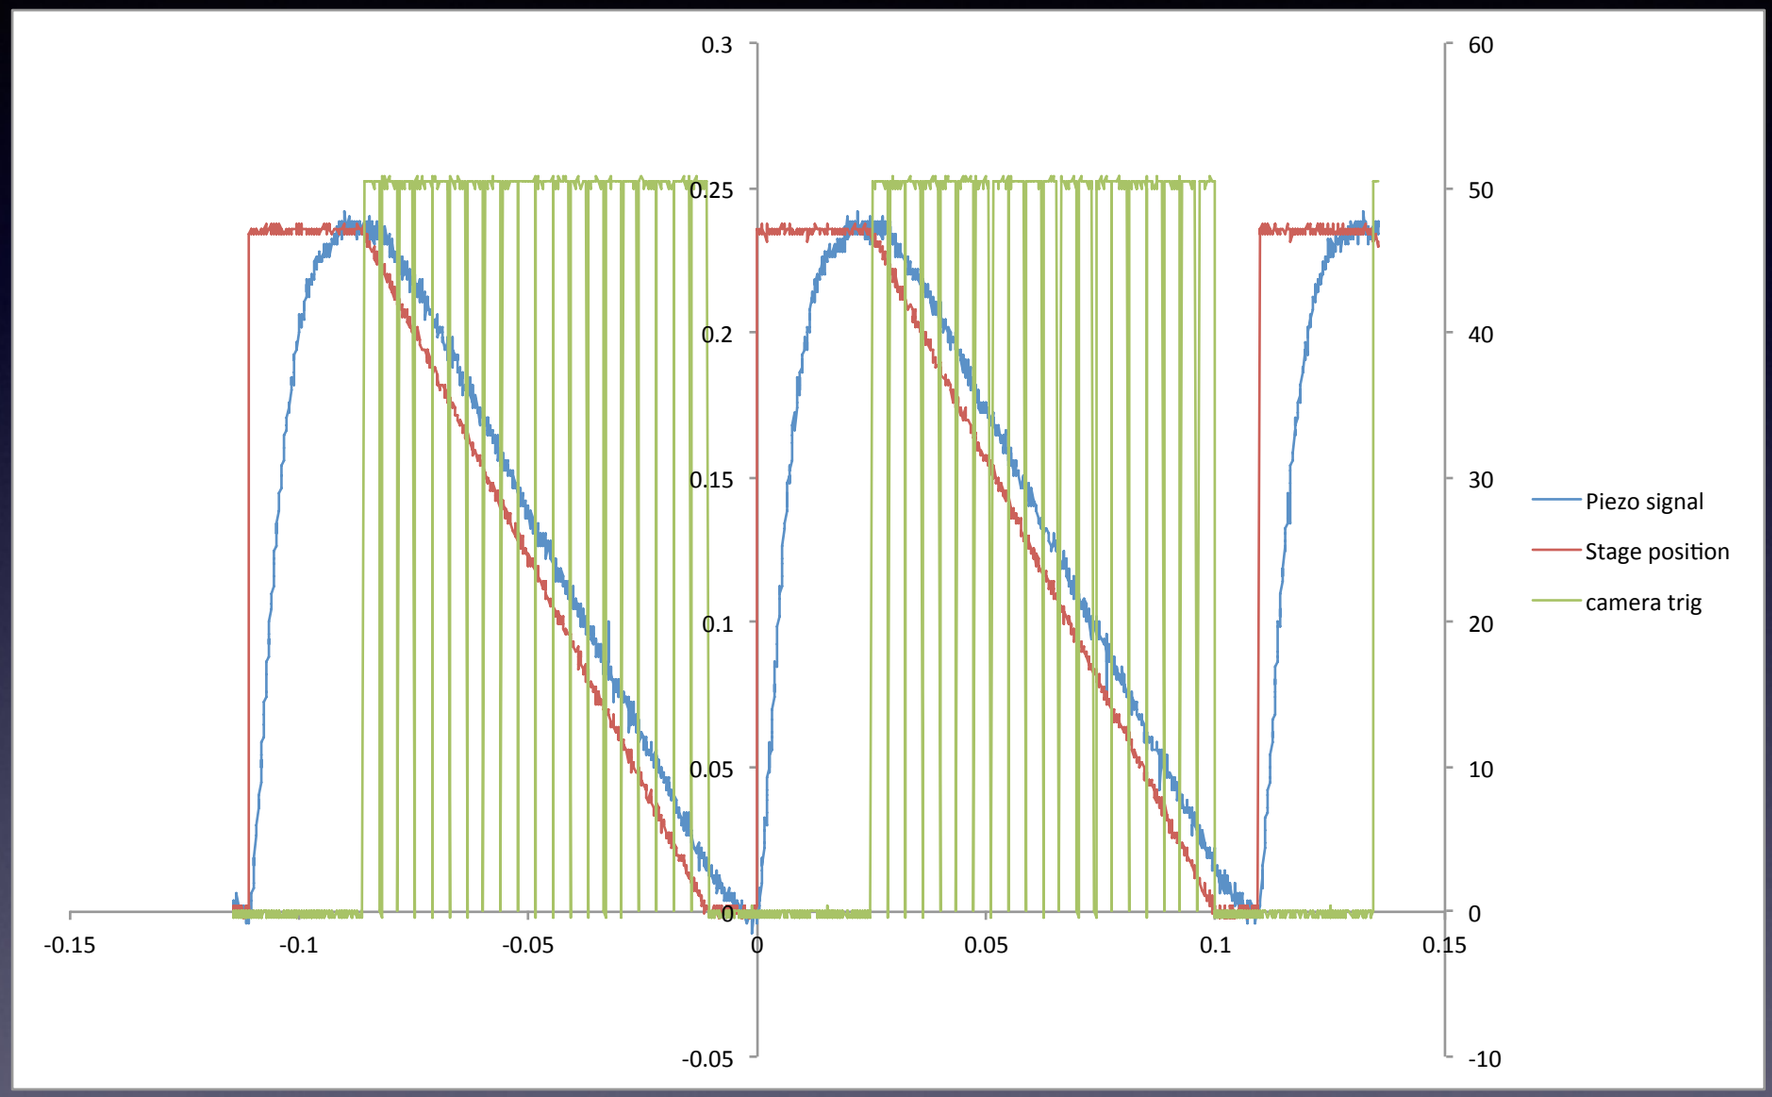
Micron OXFORD

Covential Z stack



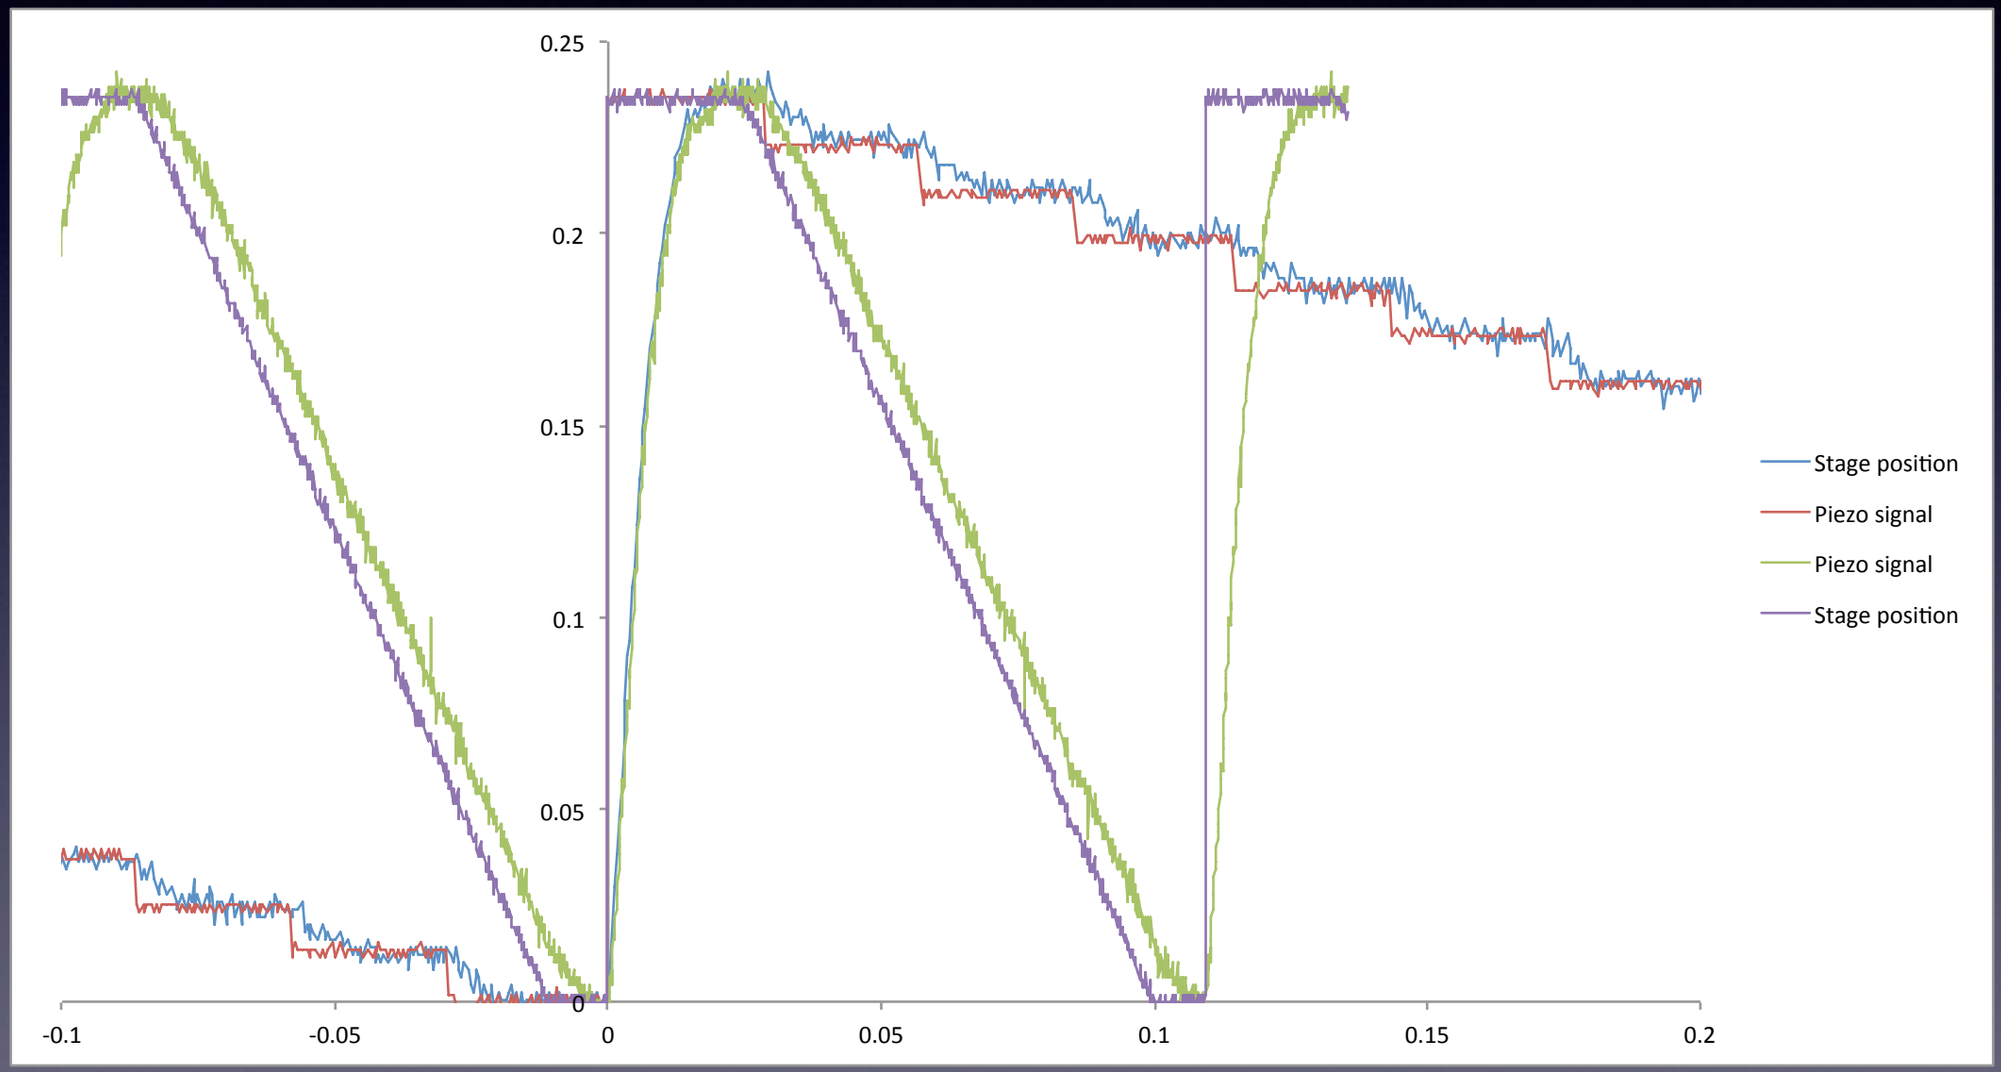
Micron OXFORD

Ramp Z stack



Micron OXFORD

Comparison: FastZ to normal



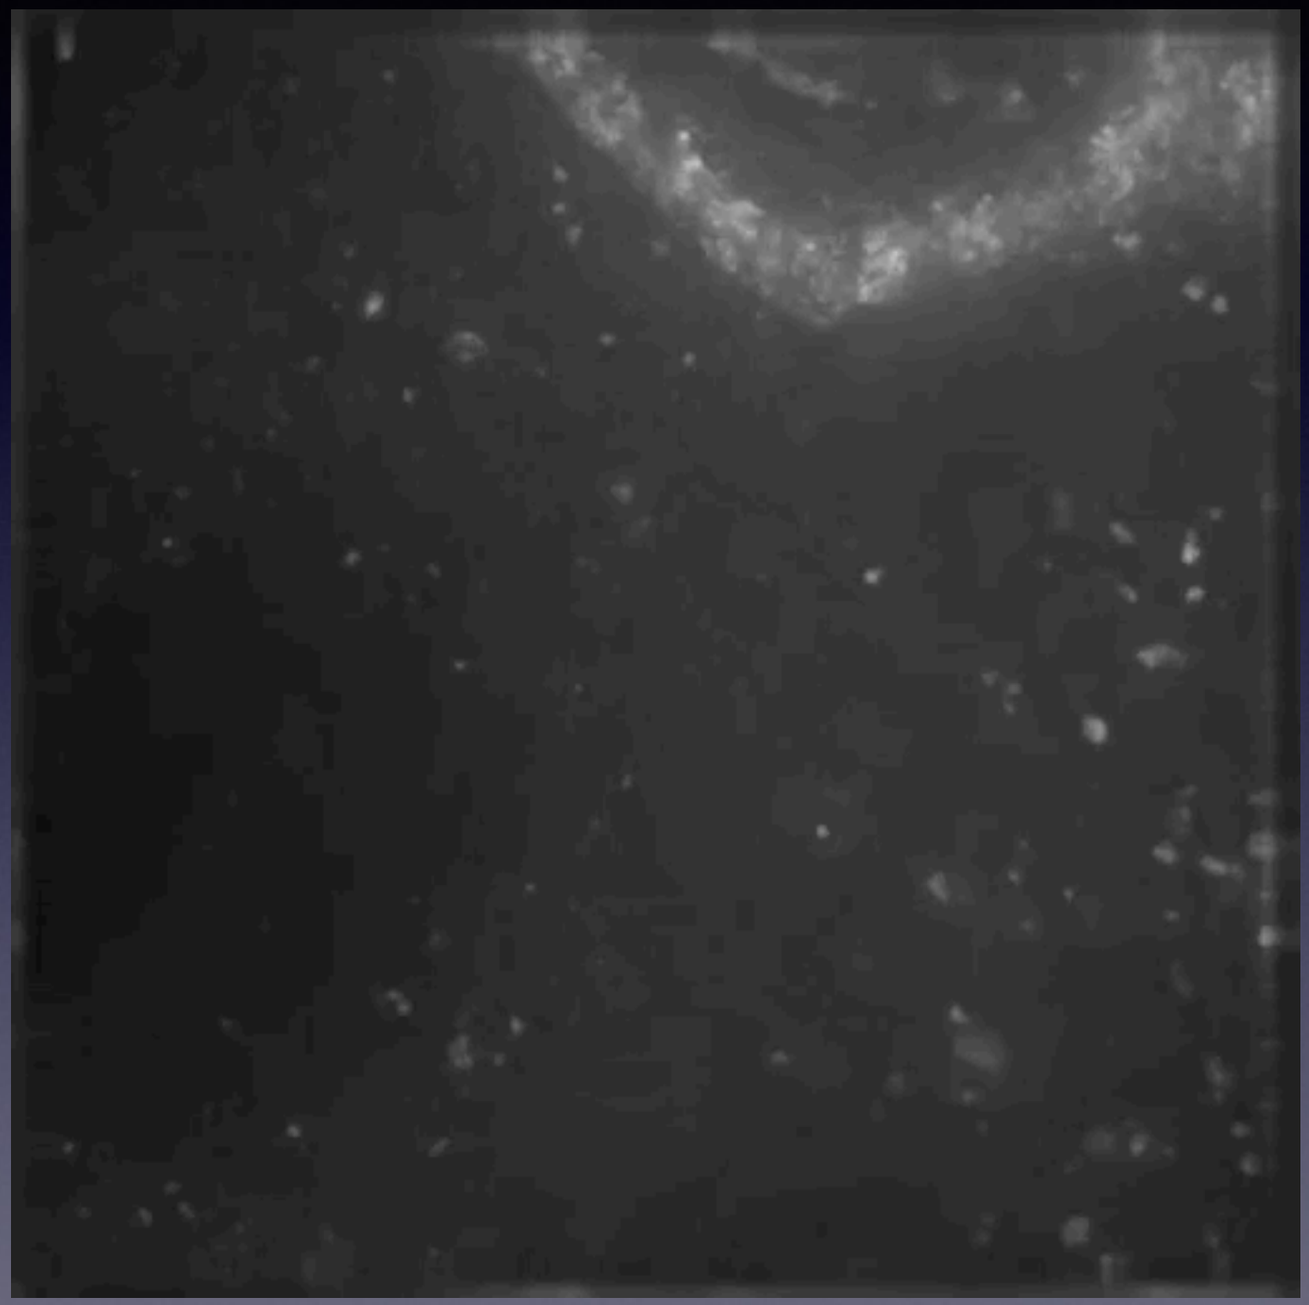
Micron OXFORD

Speed increases

- Depends on stack height, image size, exposure time.
- Test sample, 512x512 pixel images, 1 ms exposure 20 Z slices of 200 nm.
- Conventional cycle time = 575 ms
- FastZ cycle time = 109 ms

Micron OXFORD

FastZ - Results

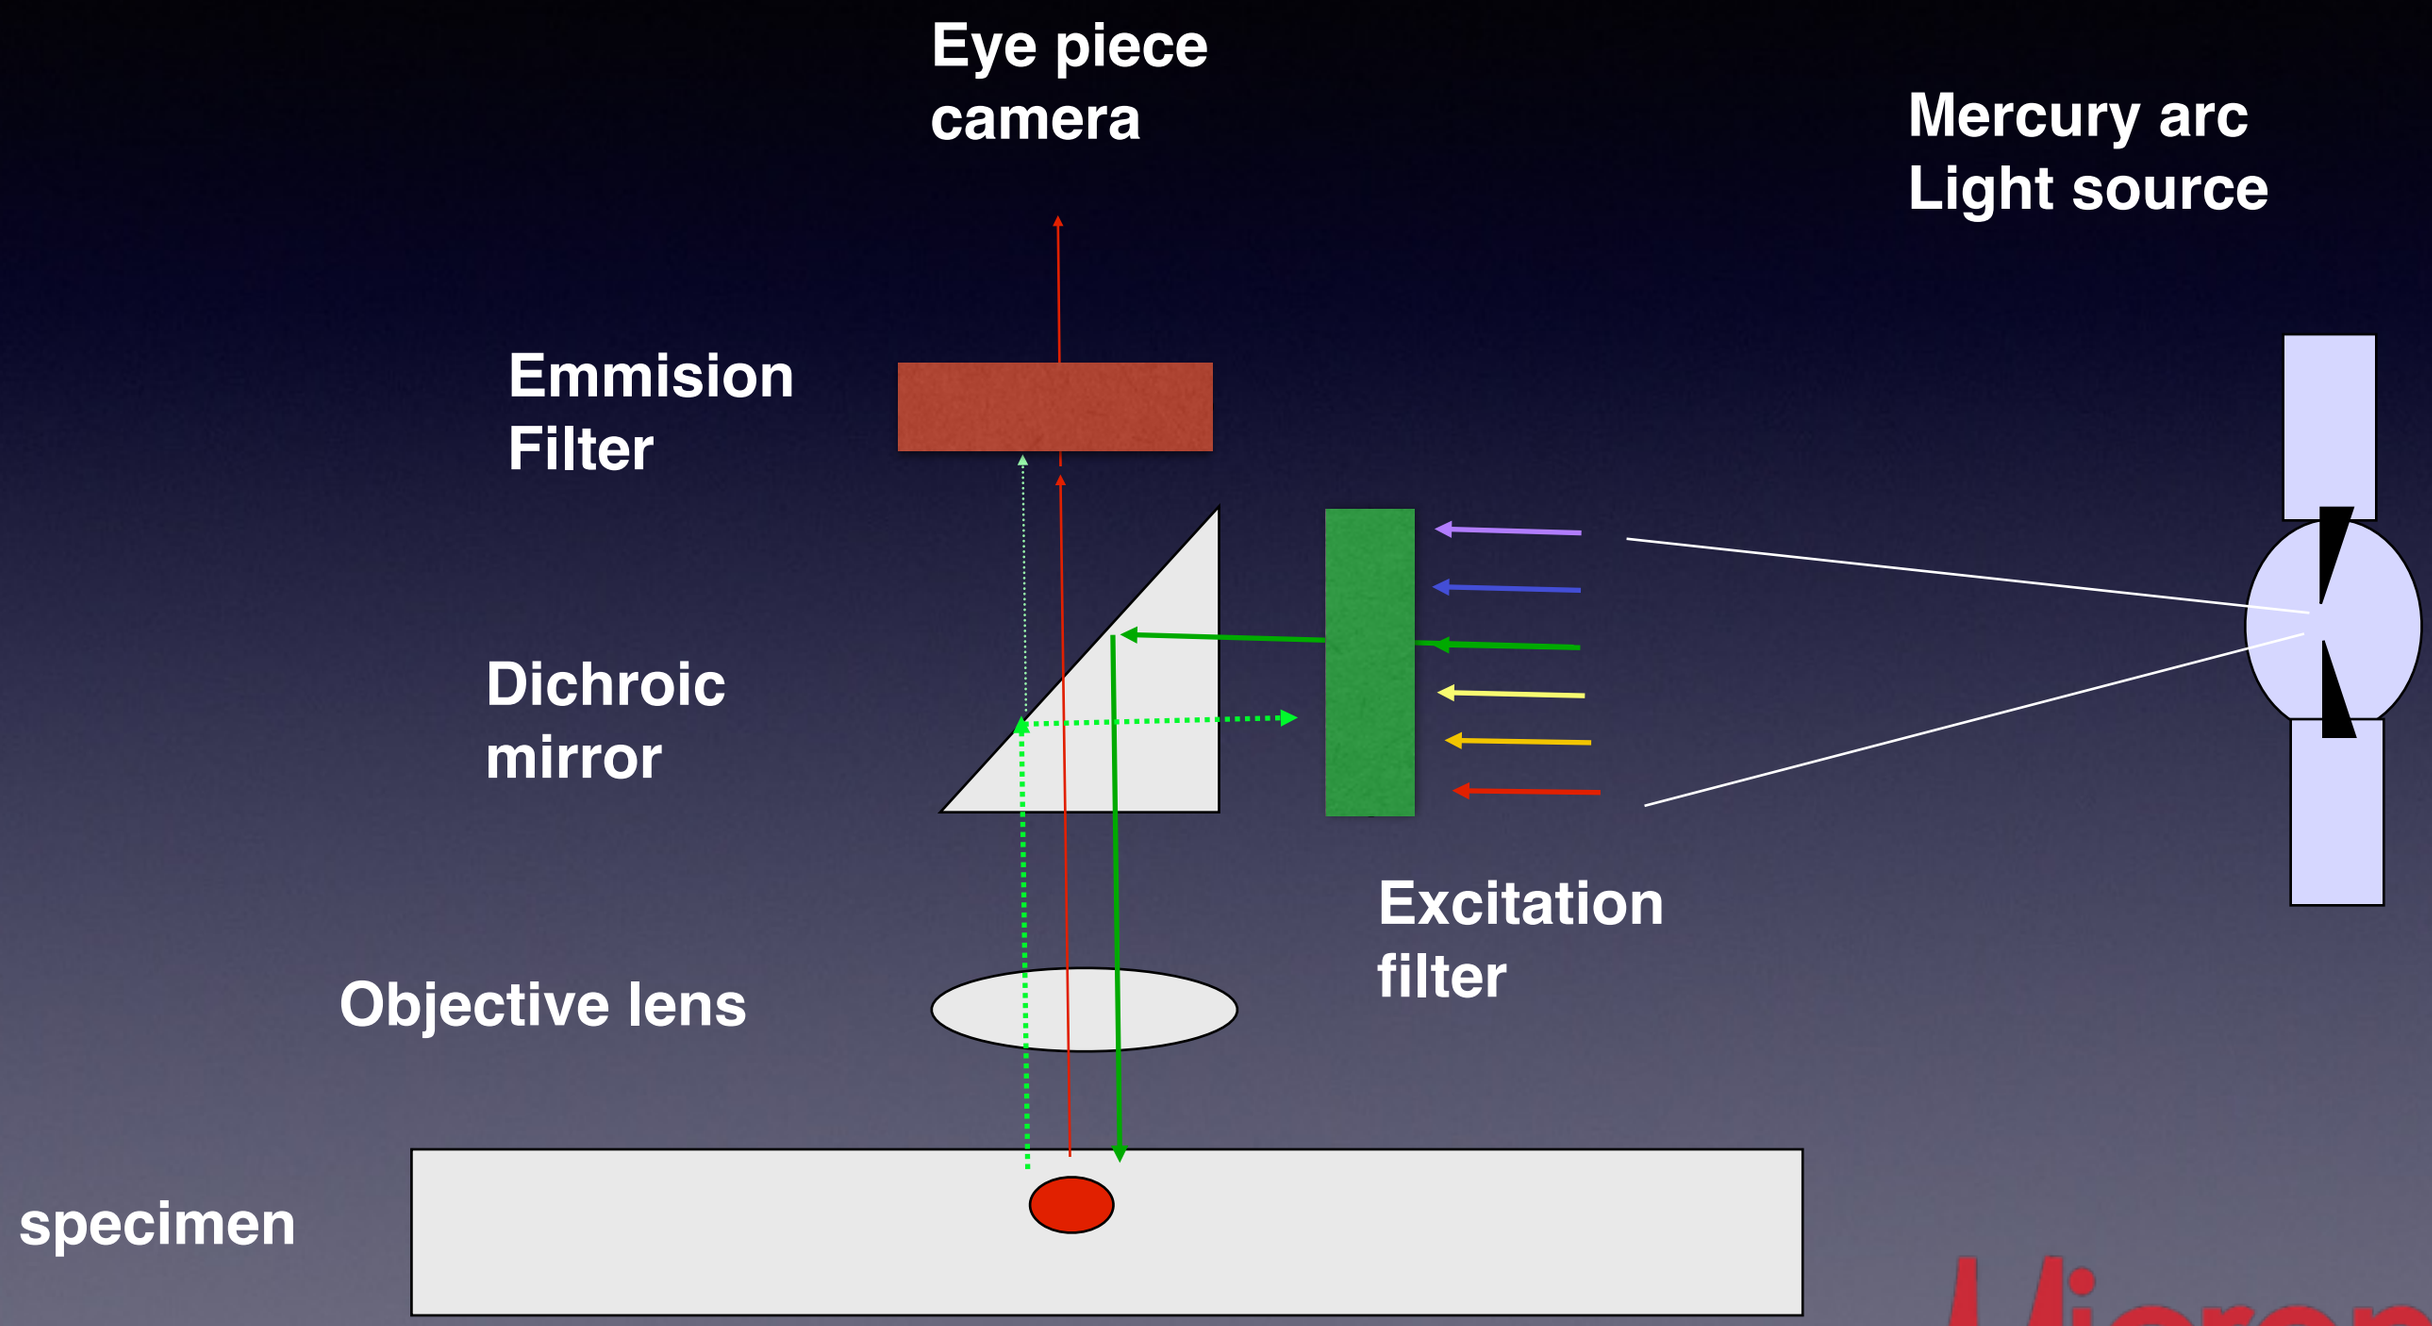


Me31B-GFP Drosophila oocyte
25-slices, 8 stacks/s - 200 frames/s

Micron OXFORD

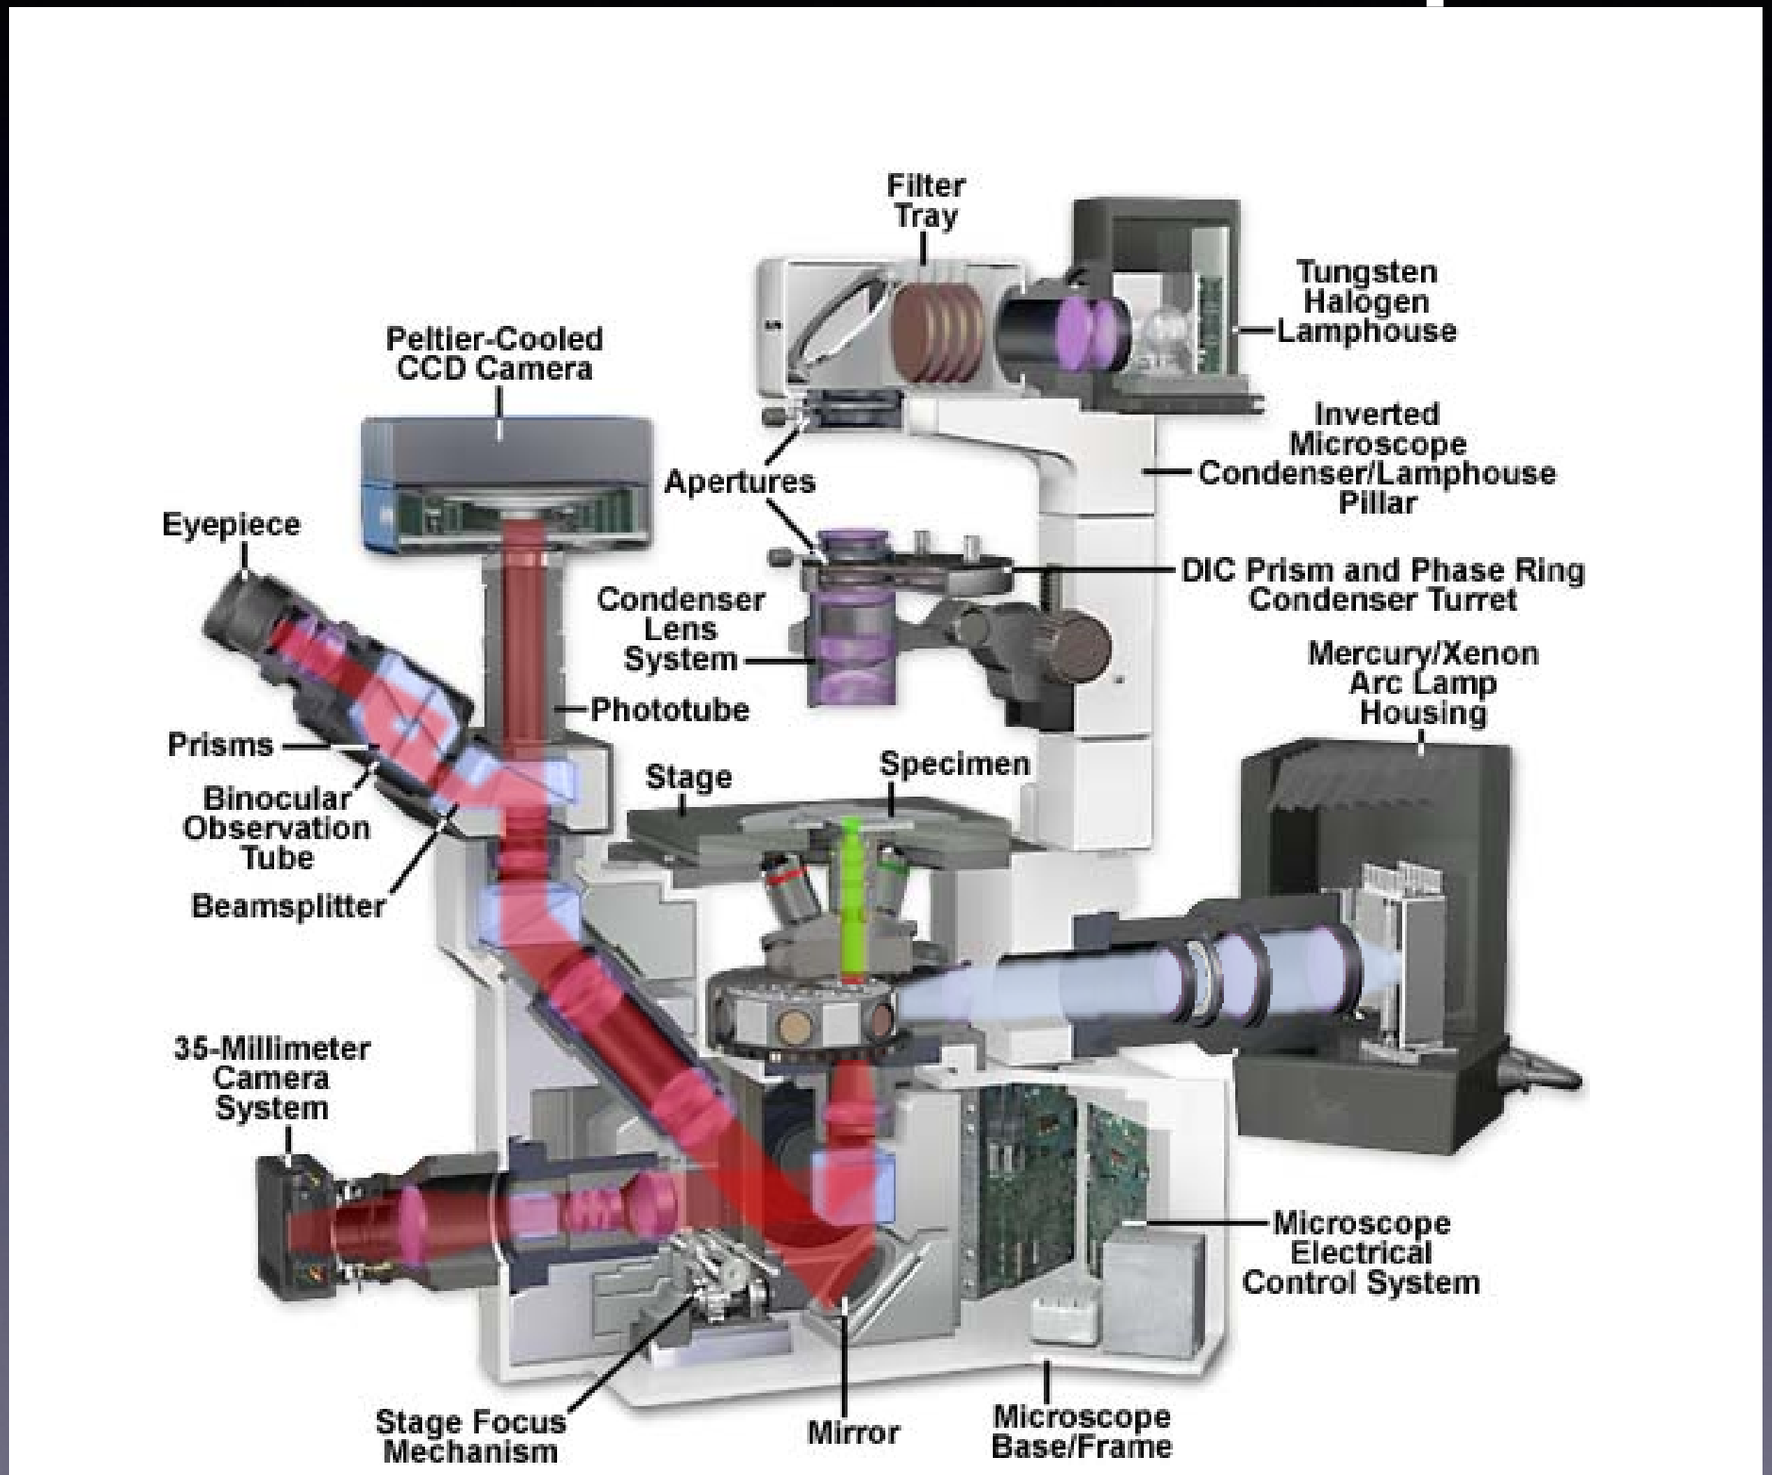
Reminder

How do fluorescence microscopes work ?



Micron OXFORD

Problem: the design of all conventional microscope stands



Micron OXFORD

How can we improve the basic design of widefield microscopes?

By dispensing with the normal microscope stand and building your own microscope from optical components on a breadboard

Micron OXFORD

The solution -build your own bespoke microscope

Mark Leake with the Slimfield TIRF microscope (Biophysics prize)

Micron OXFORD

Bespoke Microscopes

Why bother?

Specific applications -better than commercial microscopes

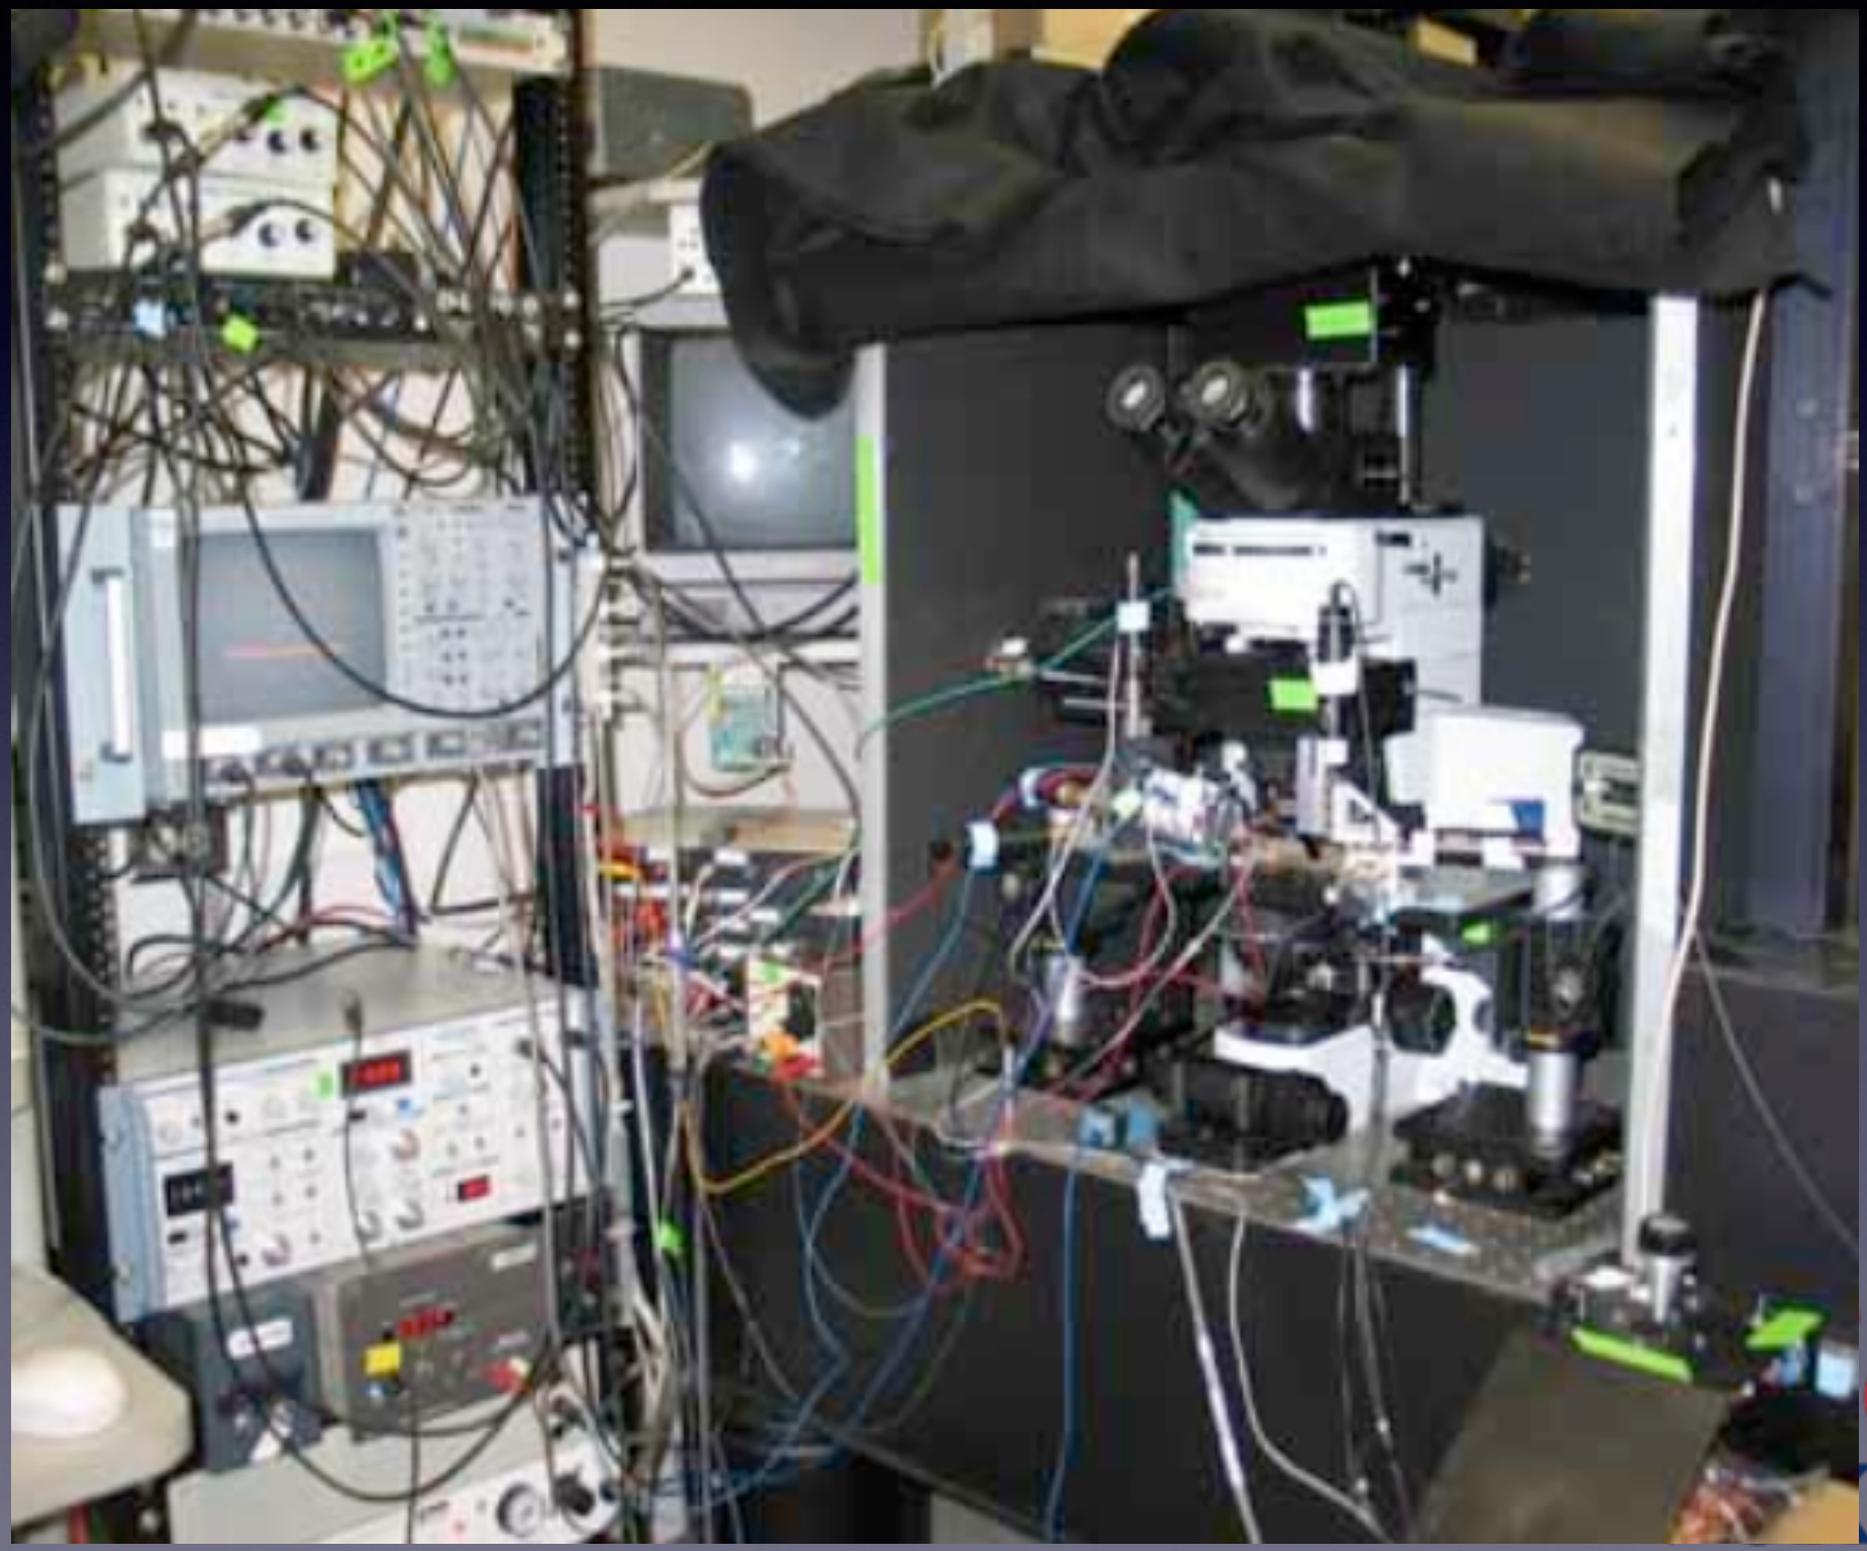
Flexibility

Cost

Micron OXFORD

Popular bespoke microscope

Multiphoton for neuroscience work



Bespoke Microscopes

Why NOT to bother?

- Salary of physicist/engineer required
- Long building time required (it's hard)
- Not supported by a company
  (repairs are costly and lengthy)
- Not always easy to use by biologists

Micron OXFORD

Example of Bespoke Microscopes

OMX-T microscope
Designed and built by John Sedat and Dave Agard, UCSF

Live PALM microscope
Designed and built by Stephan Uphoff and Achillefs Kapanidis, Micron Oxford

WOSM
Designed and built by Nick Carter and Rob Cross, Warwick University

Openspim
Designed and built by Pavel Tamacek and his team at Dresden MPI

Holographic microscope
Irwin Said and Richard Berry, Micron Oxford

Micron OXFORD

Software options

- Lab view
- Micromanager
- DIY: SDKs - C++, Python, Visual basic

Lab view example

welcome to micro-manager!

Micro-Manager Open Source Microscopy Software

µ-Manager

The Open Source Microscopy Software

µManager is a software package for control of automated microscopes. Together with the image processing application ImageJ, µManager provides a comprehensive, freely available, imaging solution.

News

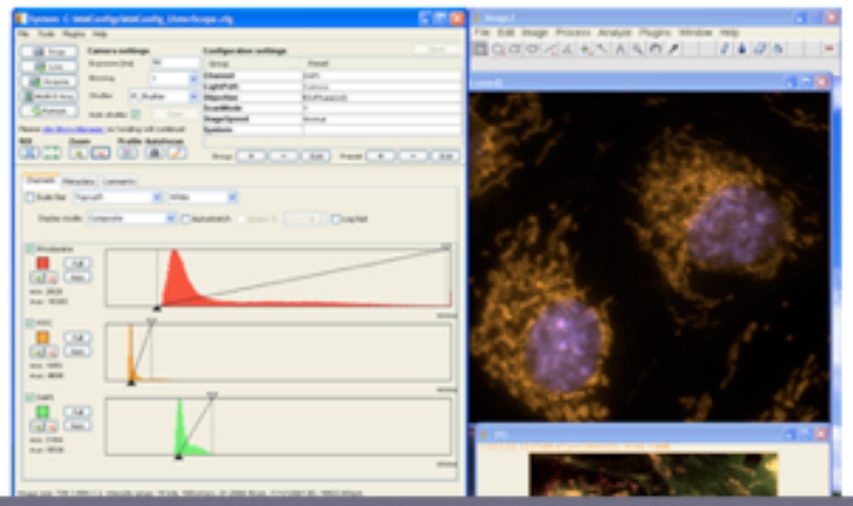
Download the most recent version (1.4) from our website. Also check out our ScreenCast for a quick tour on getting started.



µManager has a simple and clean user interface, through which it lets you execute common microscope image acquisition strategies such as time-lapses, multi-channel imaging, z-stacks, and combinations thereof. µManager works with microscopes from all four major manufacturers (Leica, Nikon, Olympus and Zeiss), most scientific-grade cameras and

cron

OXFORD

Some rules of thumb

- Clean and dust free environment
- Oscilloscope and soldering iron - you will need them!
- Good tools and spare parts
- Important to think about user interface
- Important to think about continuity of the project and workflow of experiments
- Important to think about data analysis

Micron OXFORD

Justification for Bespoke Systems

- Often necessary for specific specialised problems.
- Easily optimised for several parameters, speed, sensitivity etc...
- Can provide extremely flexible systems

BUT think hard as it is likely to be harder, longer and more expensive than at first thought.

Micron OXFORD

How expensive is it?

Building costs

Hardware ~£100-250k

Salaries 1-3 years (~£50-£150)

Total cost ~£150-350k

Commercial OMX system ~£750k

Micron OXFORD

Summary

- Recap on image formation
- Fluorescent beads showing aberrations
- How deconvolution works
- Bespoke microscope building projects pro's and cons.
